# External debt (Net International Liabilities / GDP)

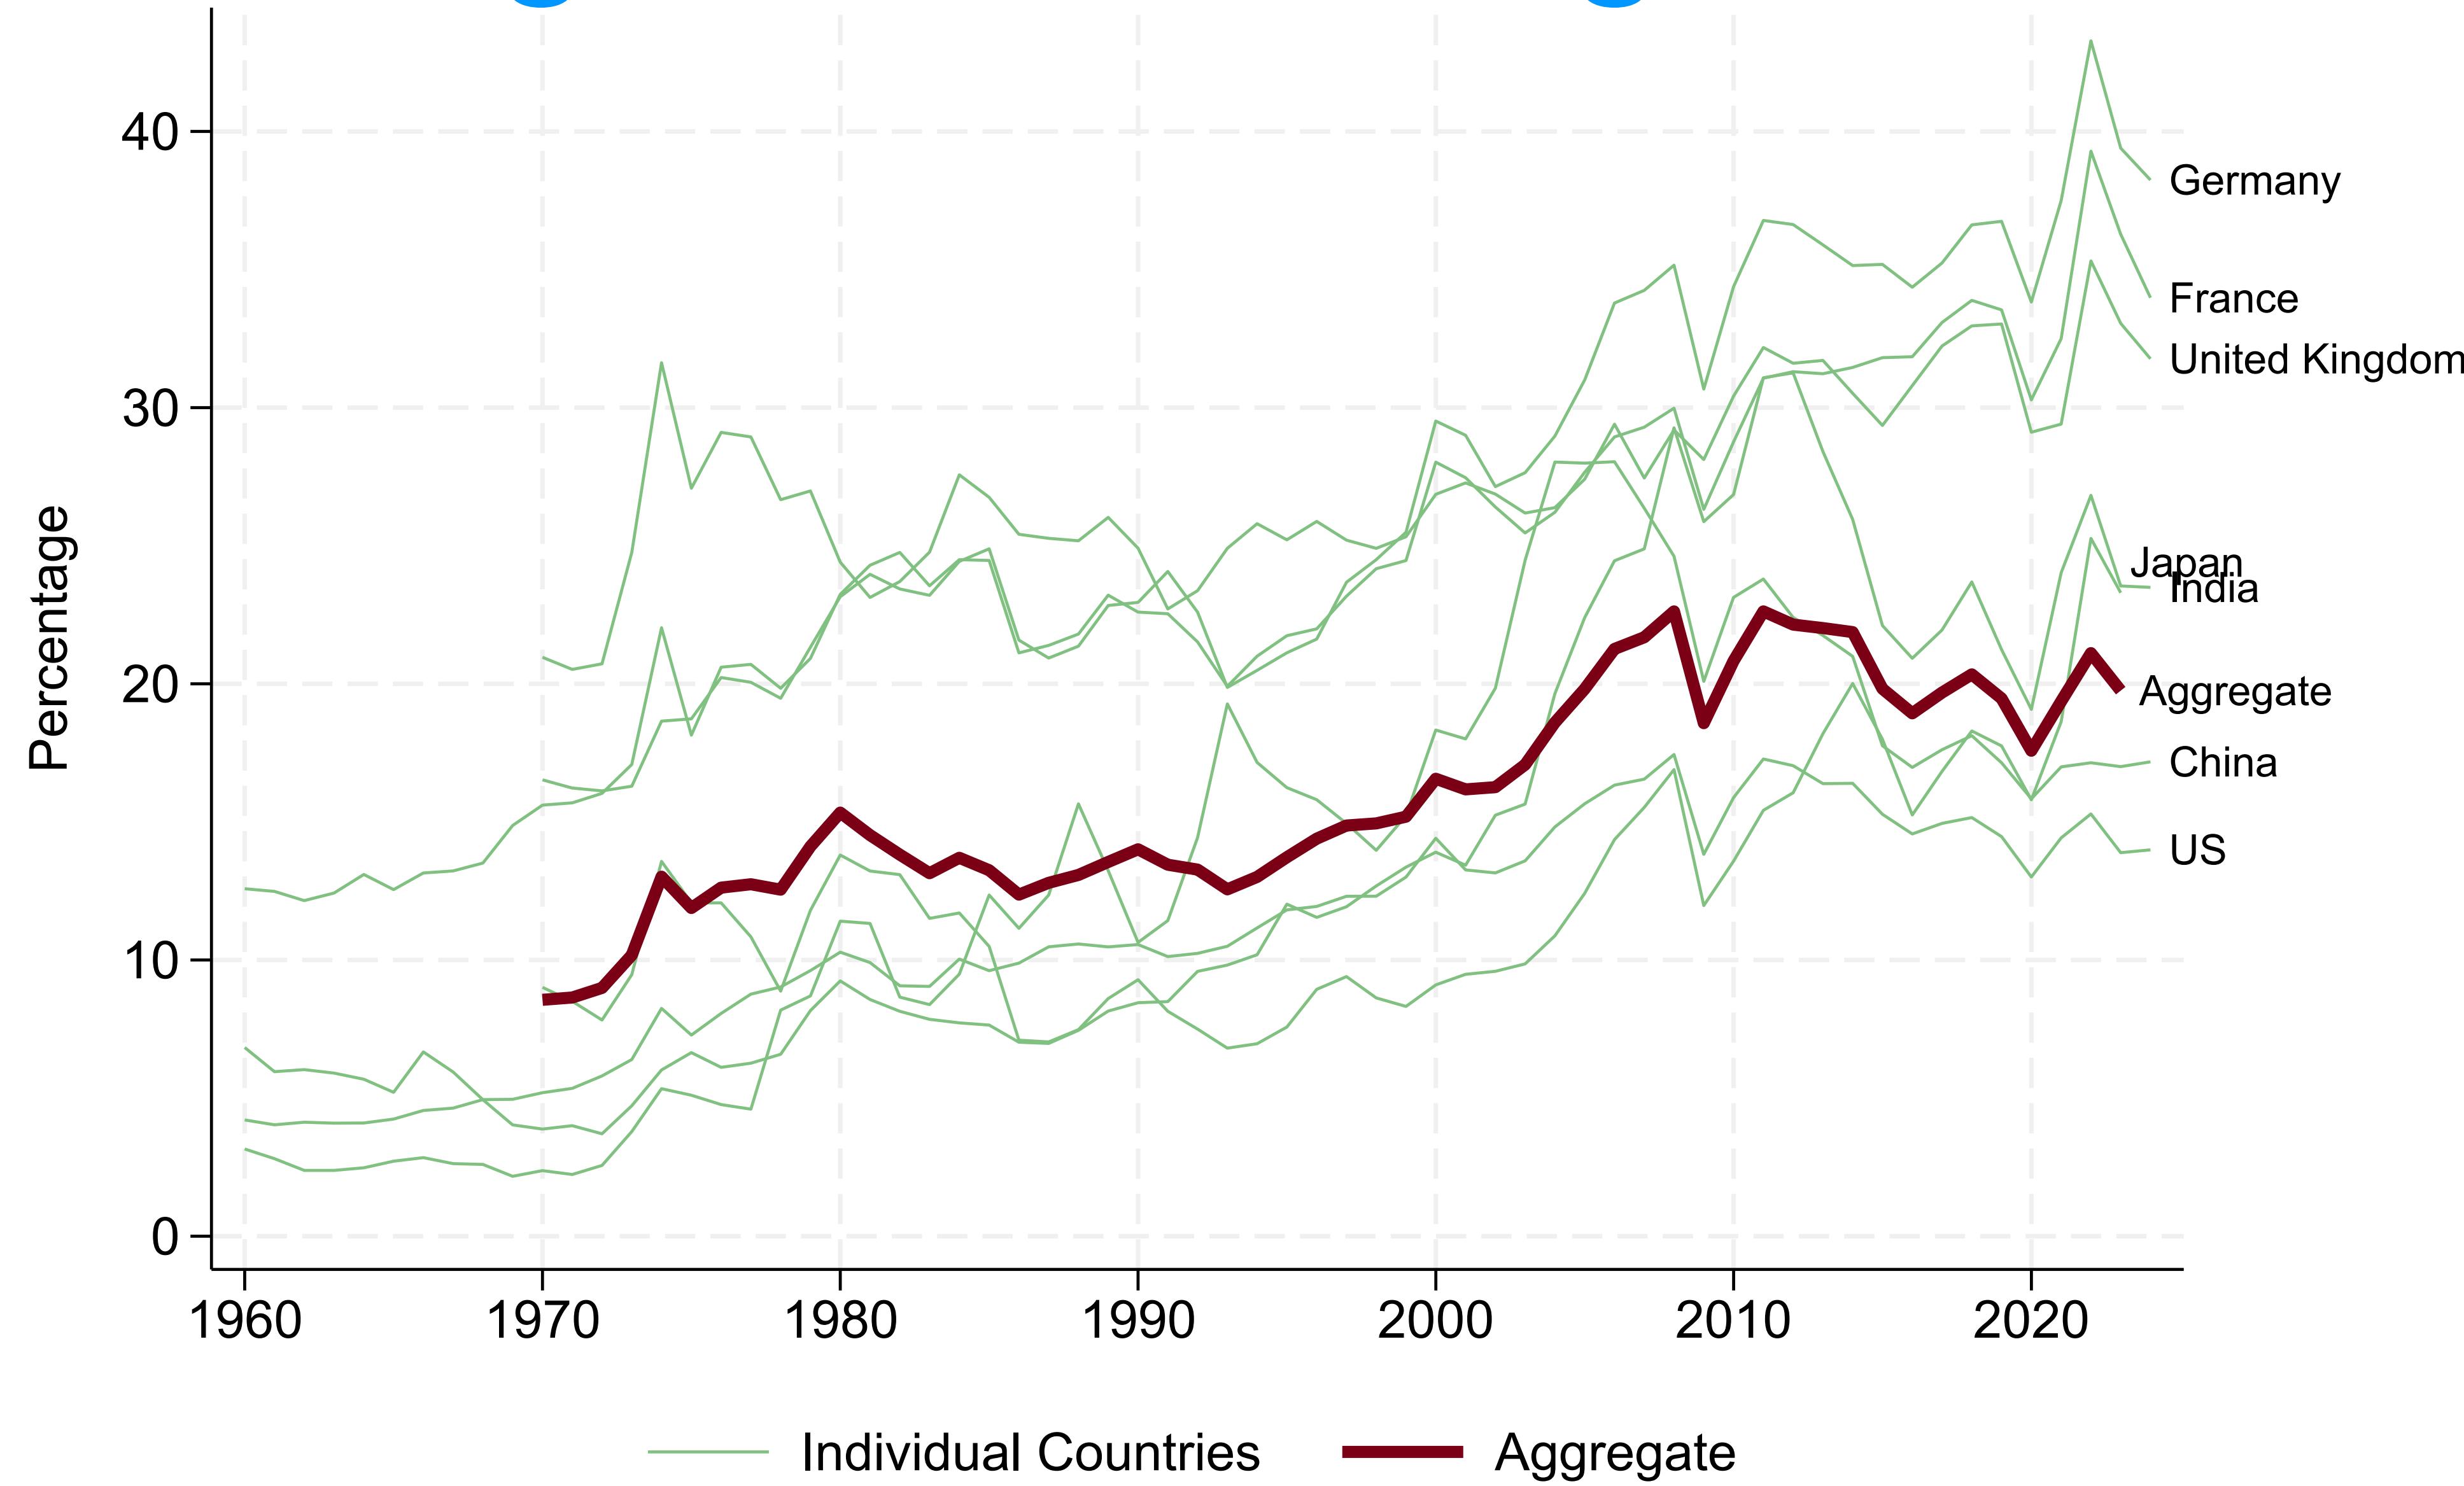

# The twin debt problem

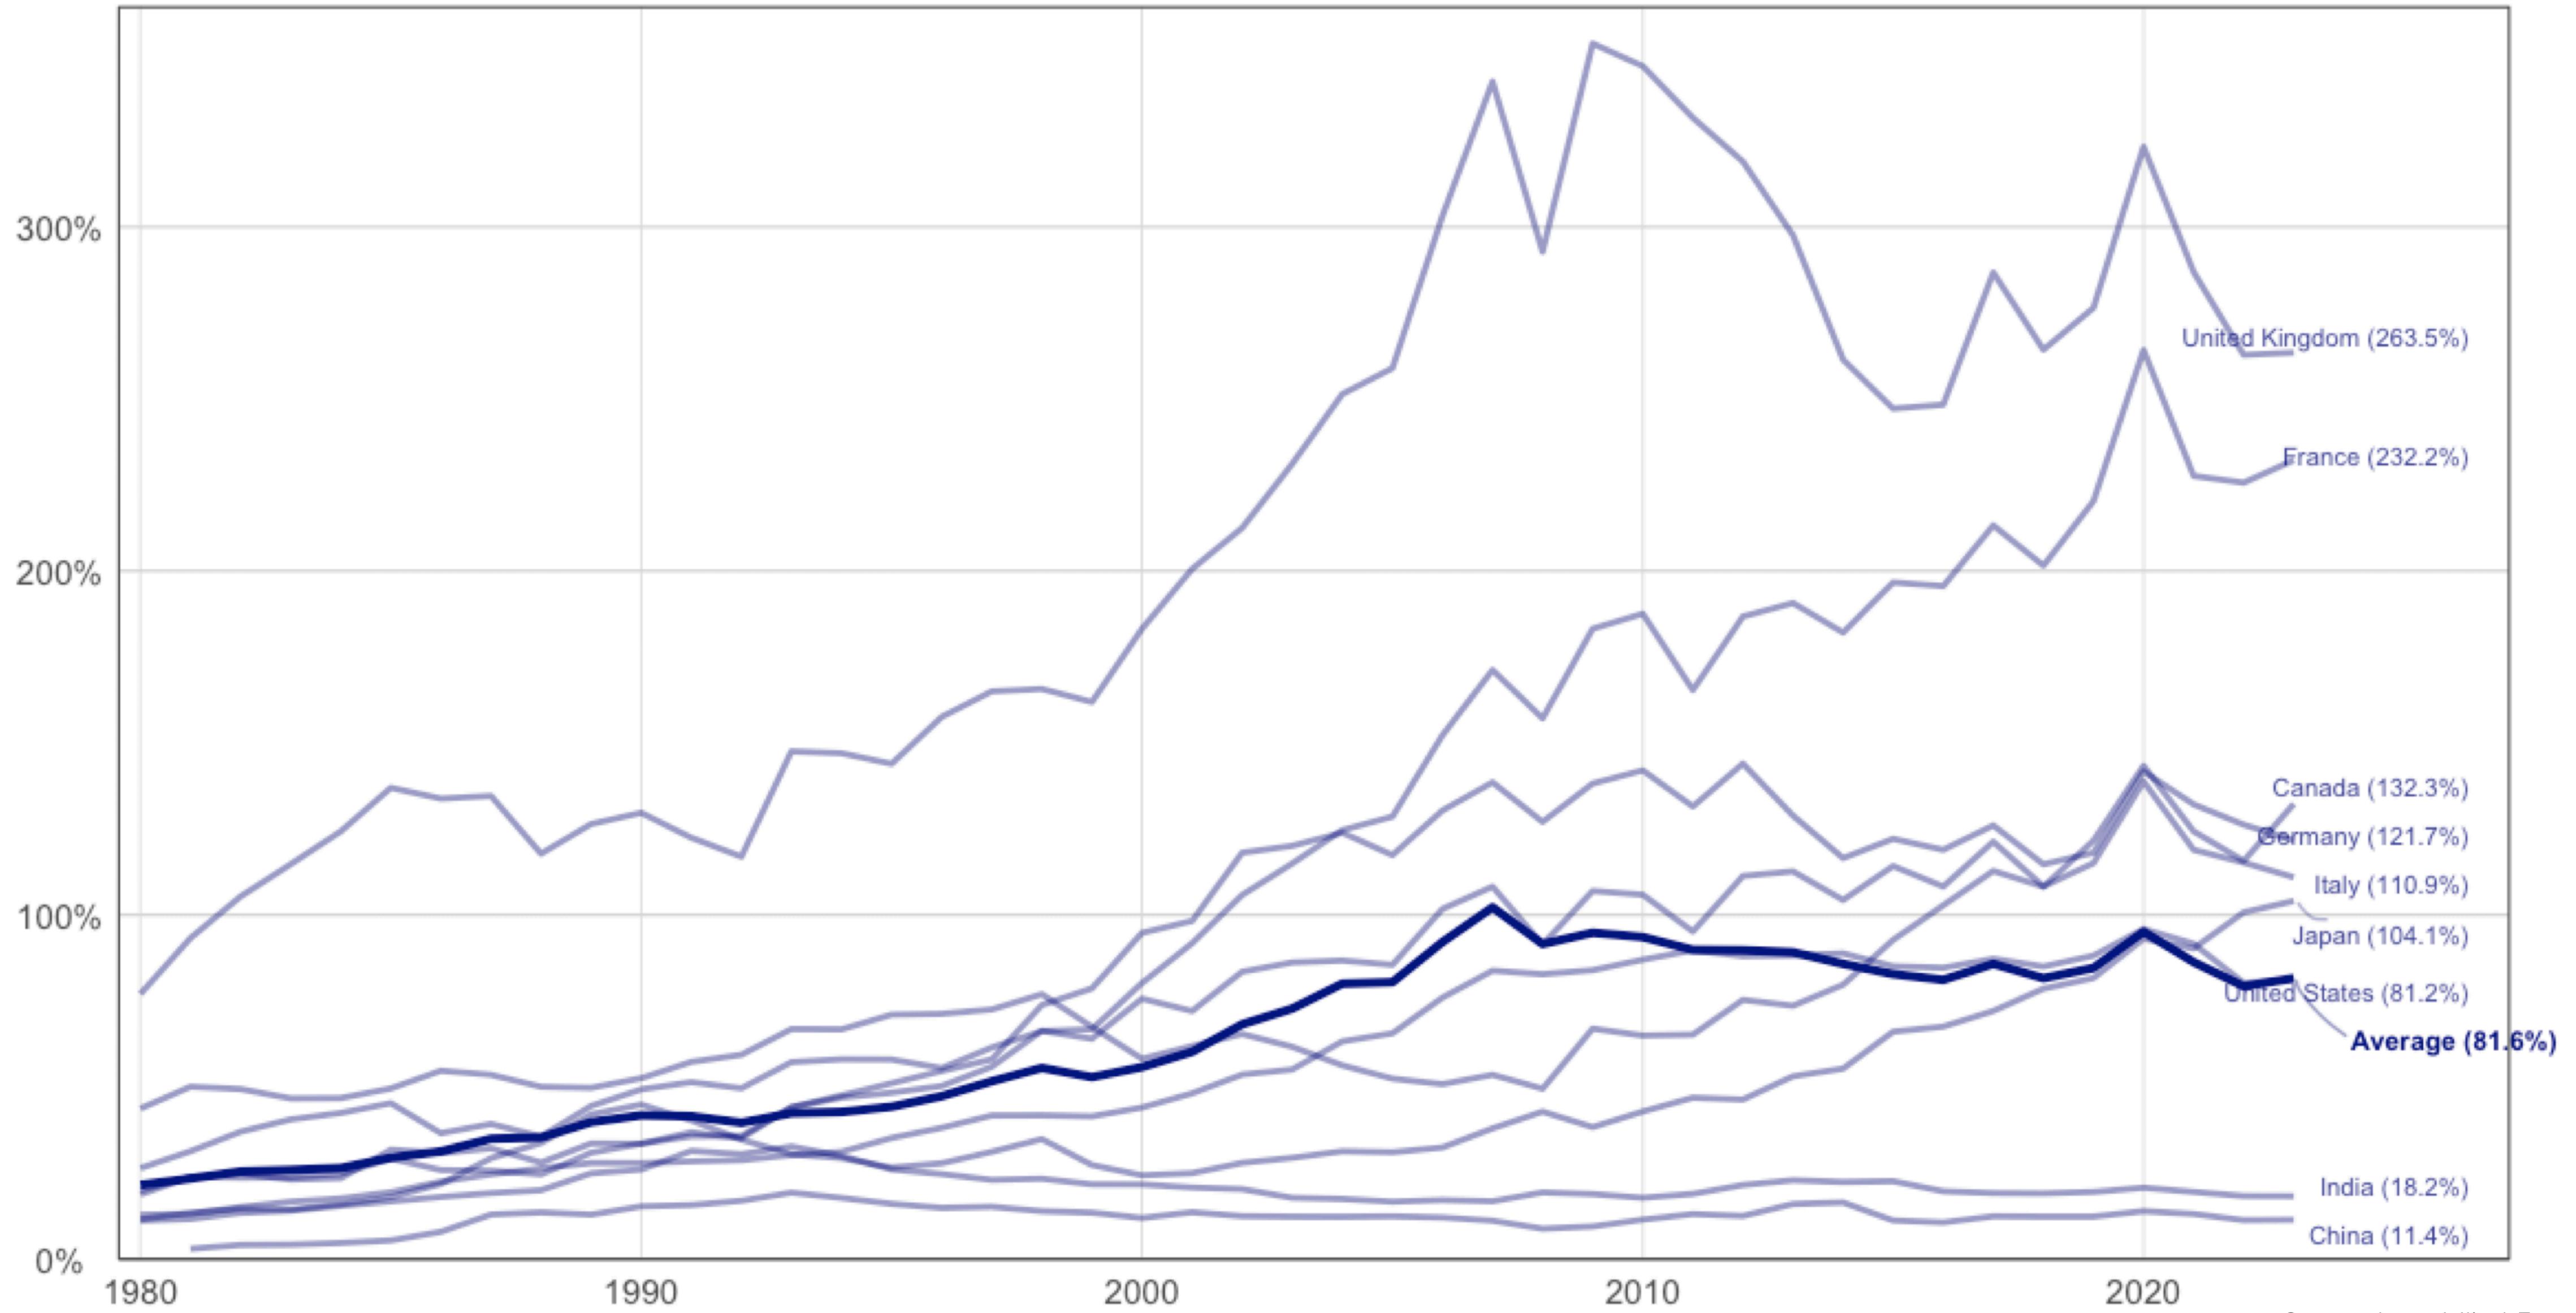

# Gross liabilities (% GDP) high for all G-7

# Tax the foreigners! Sellers of goods (Imports / GDP)

# Tax the foreigners! The creditors (Gross debt liabilities / GDP)

Source: Lane Milesi-Ferretti (2018)

# This lecture

- *Financial repression policies:*
  - Policies that lower the twin debts—loosen the budget constraints in terms of required surpluses to service the debt—by transferring resources from the holders of external/public debt to the country/government, excluding outright default
- *XXIst century:*
  - Common in 1945-85, less so in 1985-2025, coming back now
  - Different financial claims outstanding, different theories on how policies work, new empirical measures and estimates of their potential
  - Assess their current revenues, potential for more, their trade-offs

# Conceptually, budget constraints

- Accounting:

$$\Delta \text{Net liabilities} = \text{Net payouts from liabilities} - \text{Net Income}$$

- Economics:

No Ponzi scheme on the liabilities

- Then:

$$\text{Debt} = \text{EPV} \text{ (net income)}$$

- change in market value of the debt
- + EPV (discounts on debt returns)

# Public Debt =

EPV(of primary surpluses)

+ Market devaluation of the liabilities

+ EPV (discounts on public liabilities)

- Conventional term

- Tax the financial sector or creditors

- Sovereign default

- Unexpected inflation

- Often ignored

- Seignorage from physical currency
  - Wheneve service and so a discount
  - Make supply of service scarcer

# External Debt =

EPV (trade balance and transfers)

+ Market devaluation of the liabilities  
and revaluation of assets

+ EPV (exorbitant privilege)

- Conventional term
  - Tax the foreign creditors
- Valuation terms
  - Unexpected depreciation of currency
- Composition of assets and liabilities
  - Exorbitant privilege
  - Global insurance premiums
  - Make supply of services scarcer

# The three classes of financial repression

Debt = EPV (net income)

– change in market value

+ EPV (discounts)

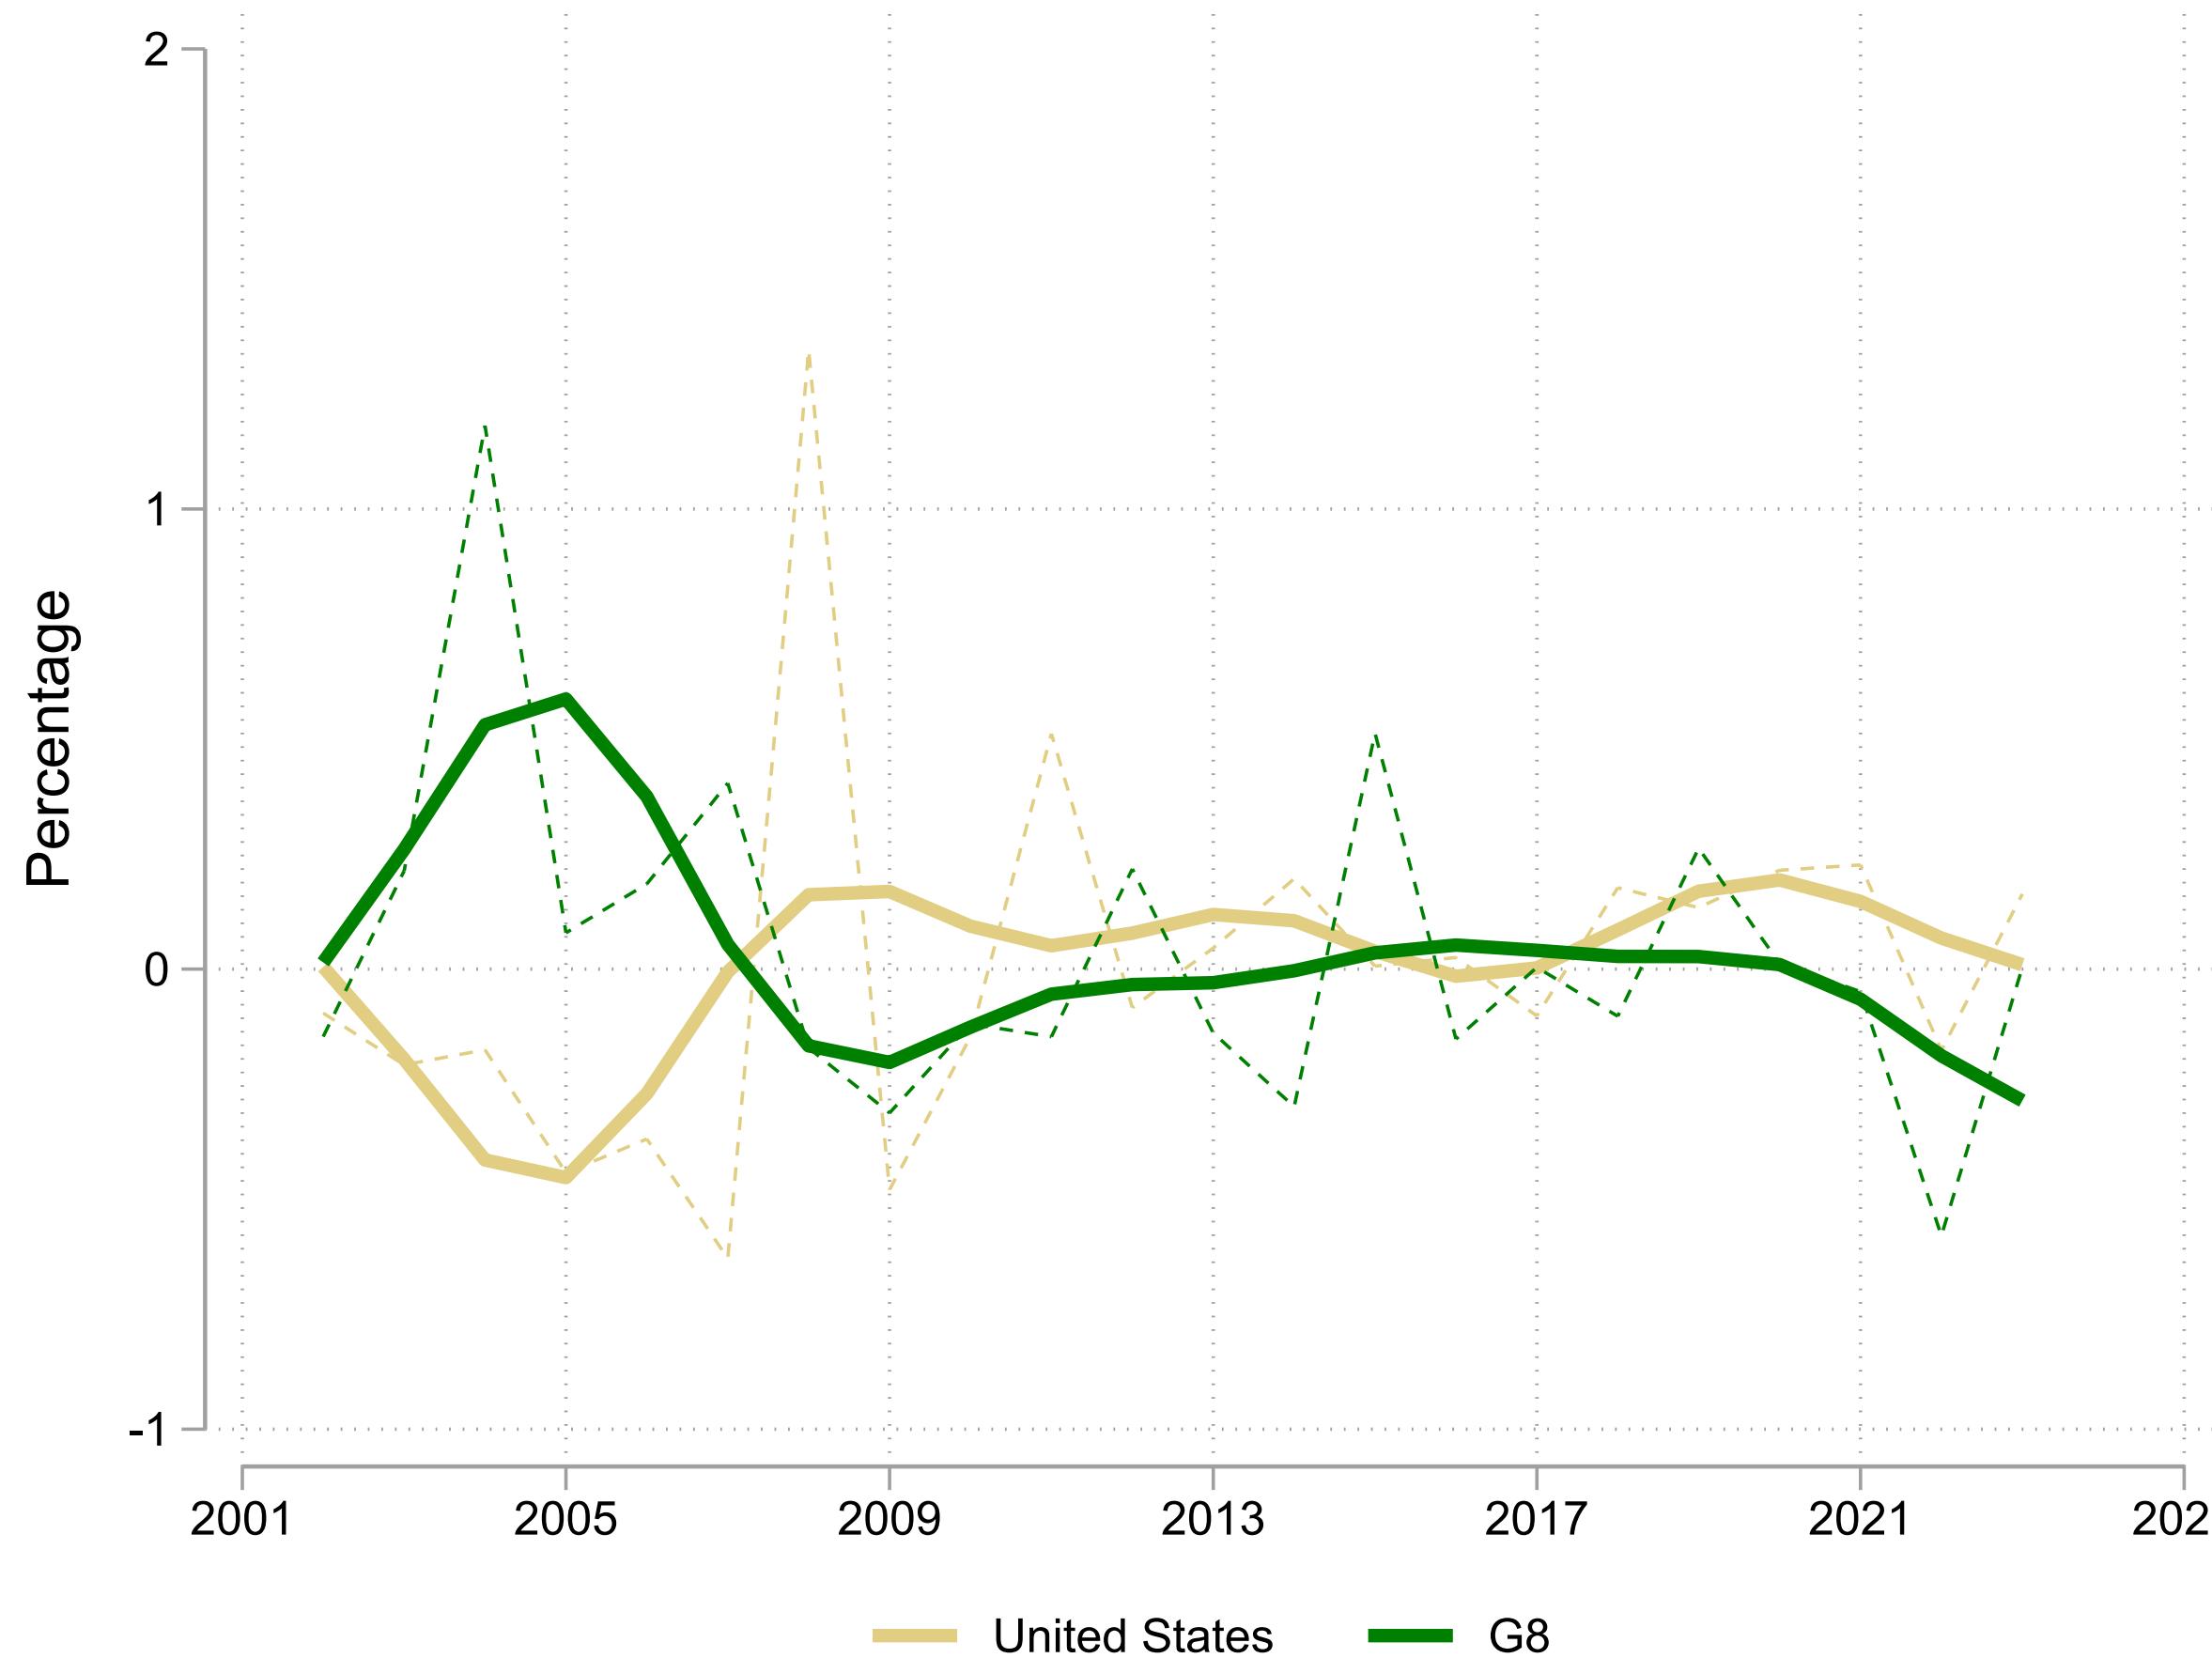

• Zero benchmark:

• *ad valorem* tax on returns raises first term, but lowers third term

• Permanent increase in value of flow of service raises third term, lowers second term

- Raise resources directly, independent of the stock of debt
- Raise resources by changing value of the stock of debt unexpectedly.
- Raise flow of resources that are proportional to the stock of debt.

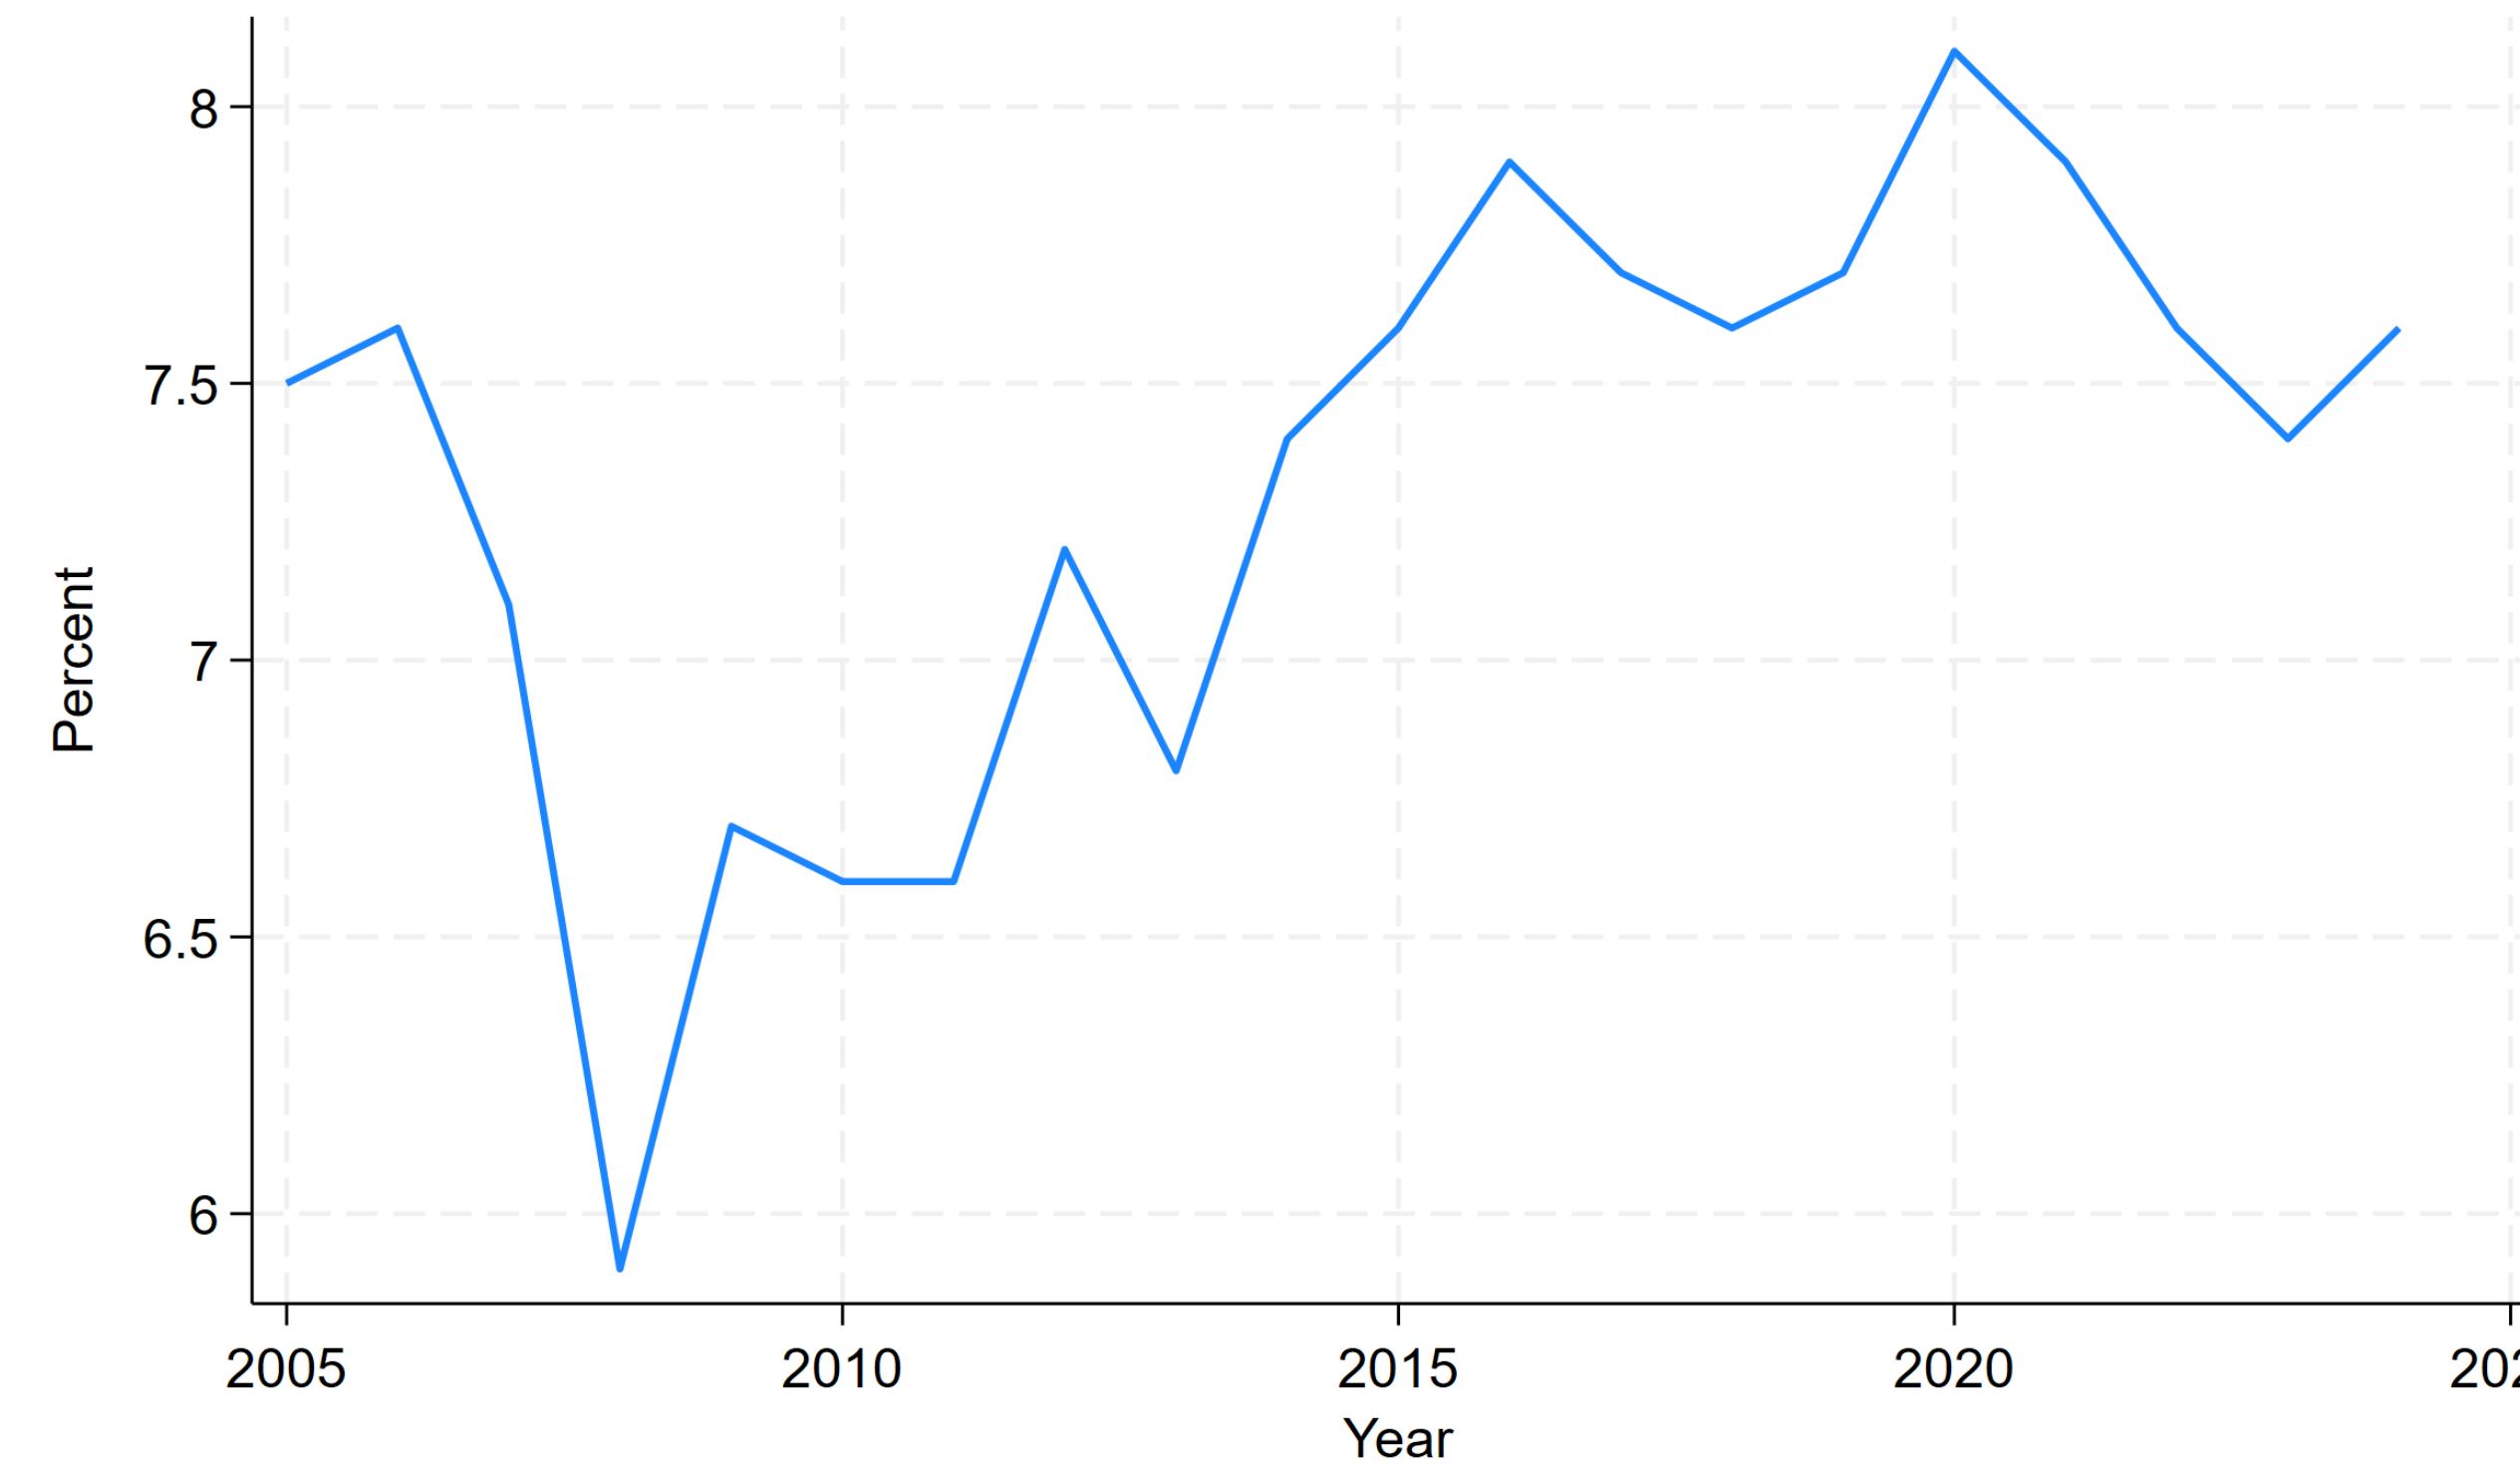

# Zero on average, yet large all the time

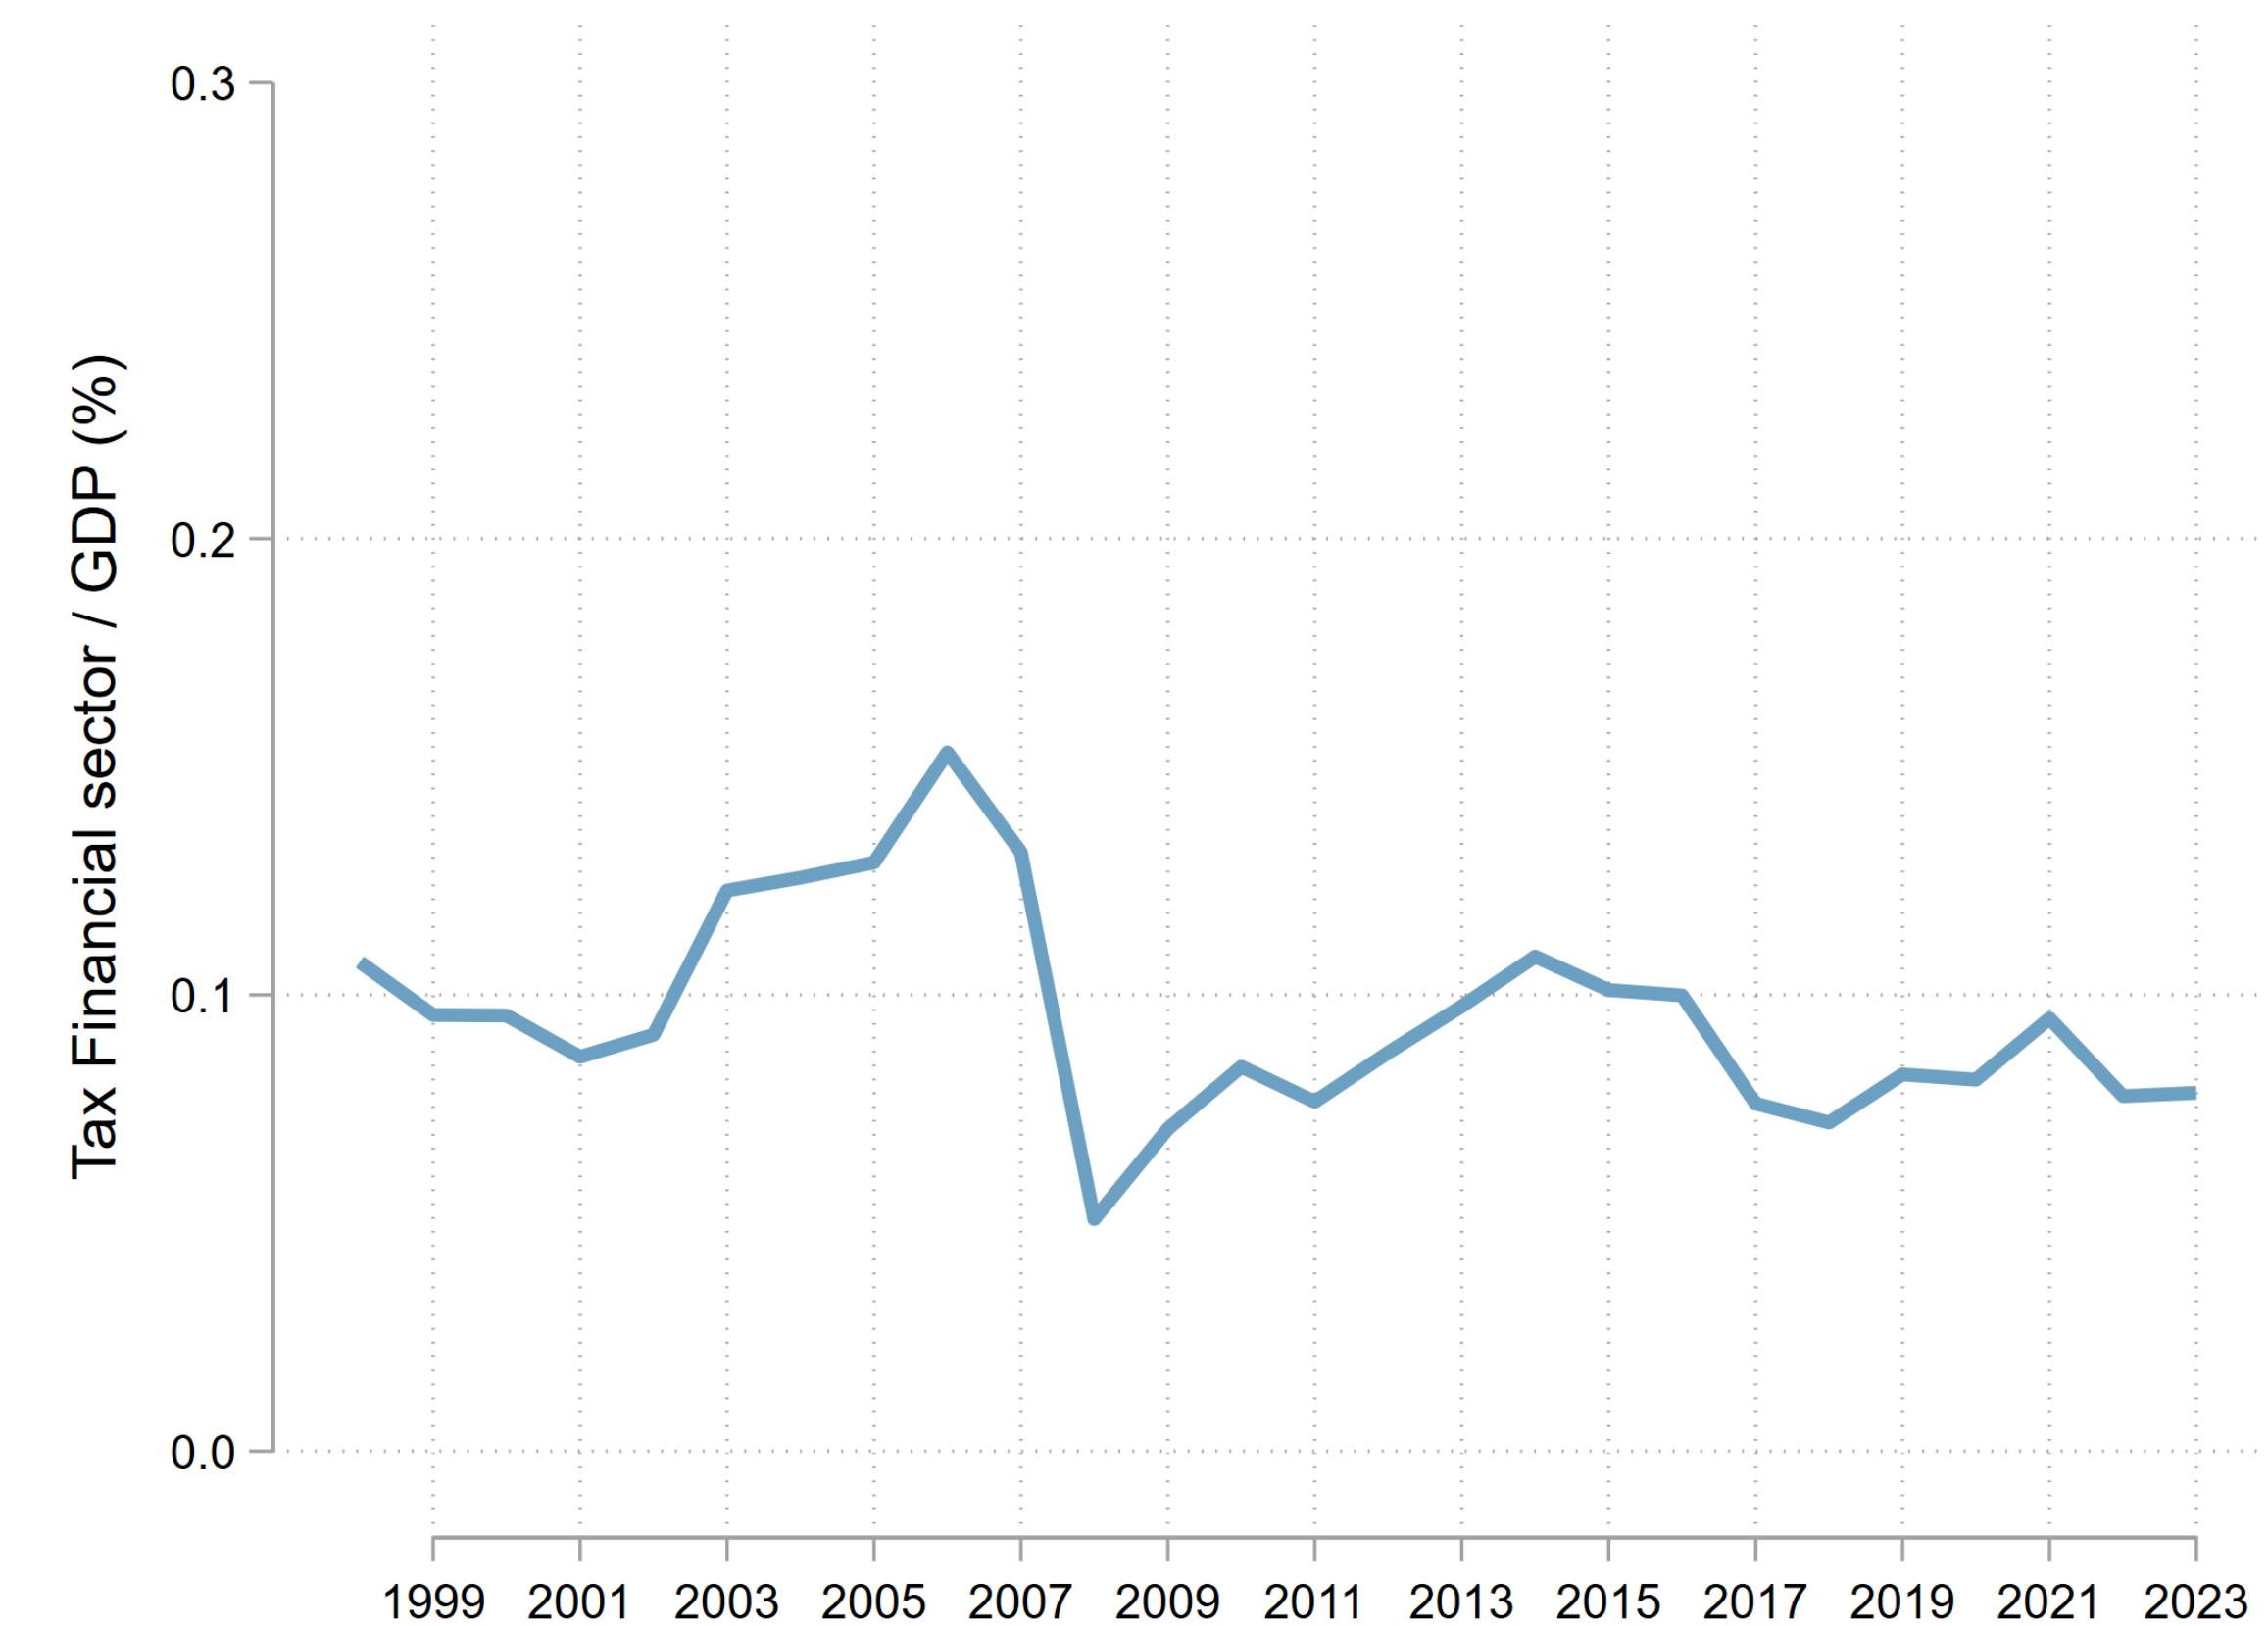

- On the left, return on foreign liabilities. Rose for the US after 2010s
- On the right: interest paid on debt minus average return on capital

# Surpluses: taxing the VA of the financial sector

*US financial sector value added / GDP*

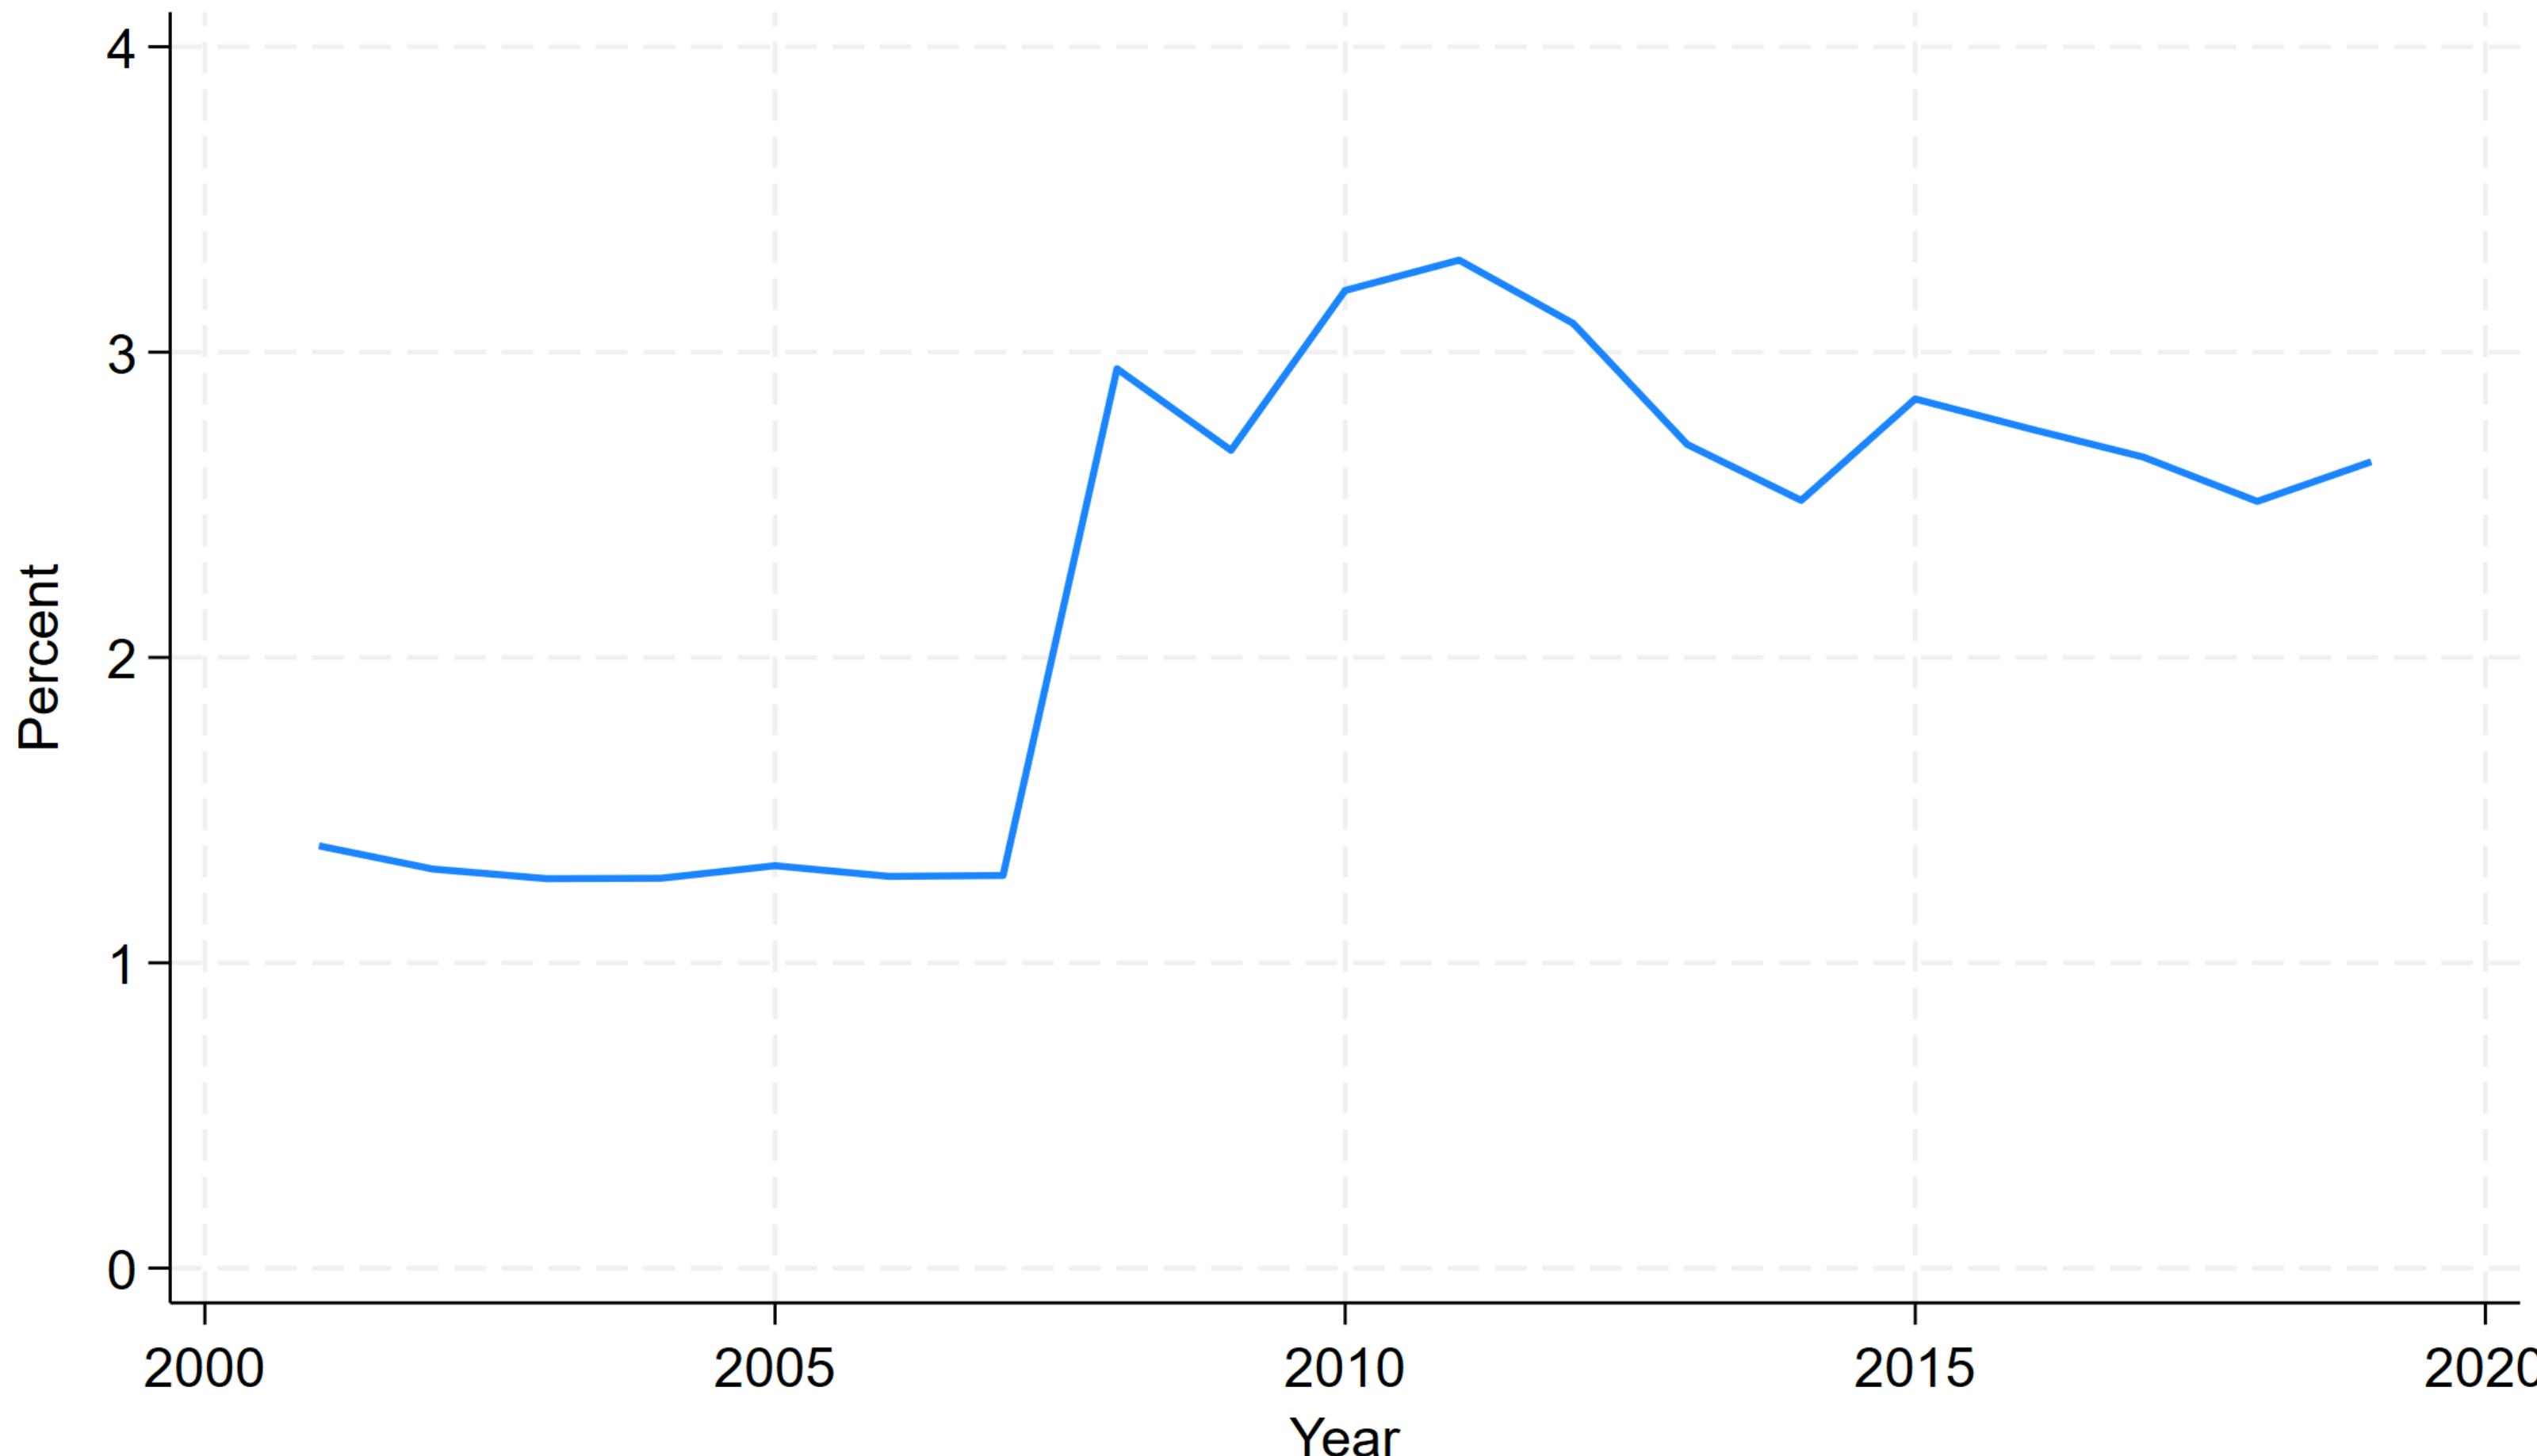

*Taxes / GDP*

# Surpluses: taxing flows in the financial sector

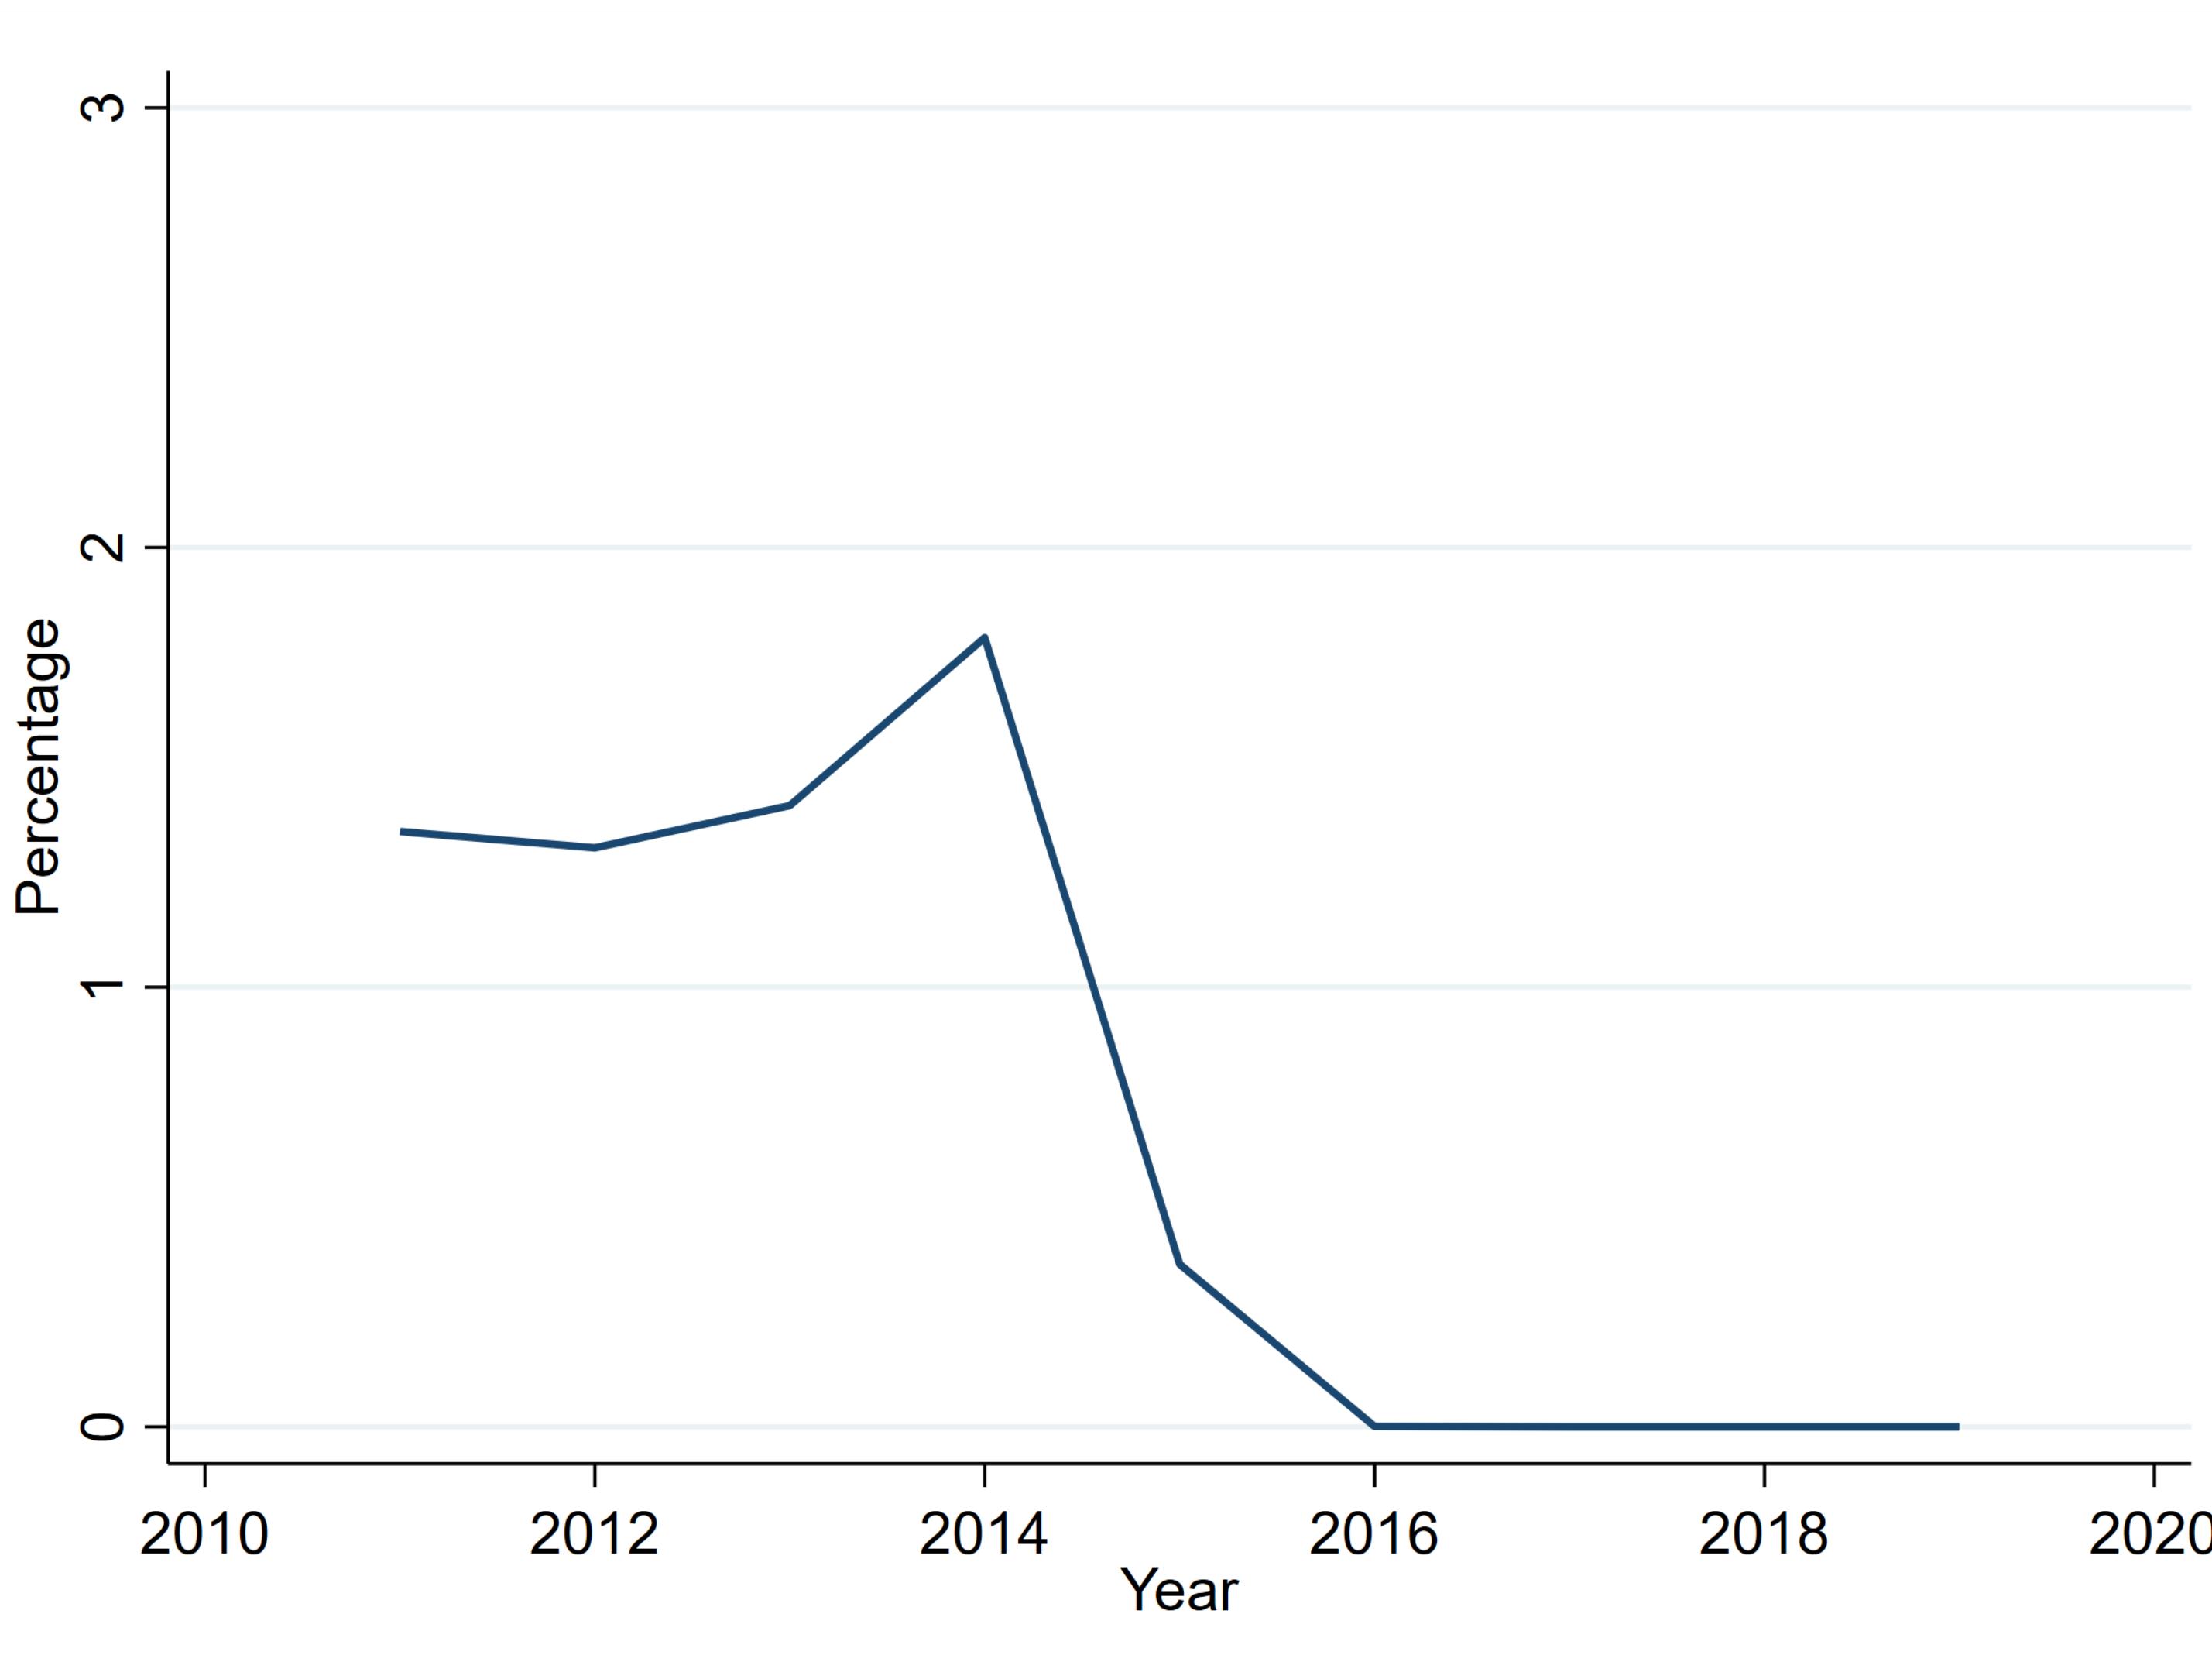

*Revenue from tax on capital inflows / tax revenues*

- Brazil, October of 2009
- Transaction tax on equity and fixed income flows
- Extended to derivatives, peaked at 6% in 2012, some of it repealed in mid 2013, many remained with constant tinkering
- Debatable effectiveness at managing capital flows

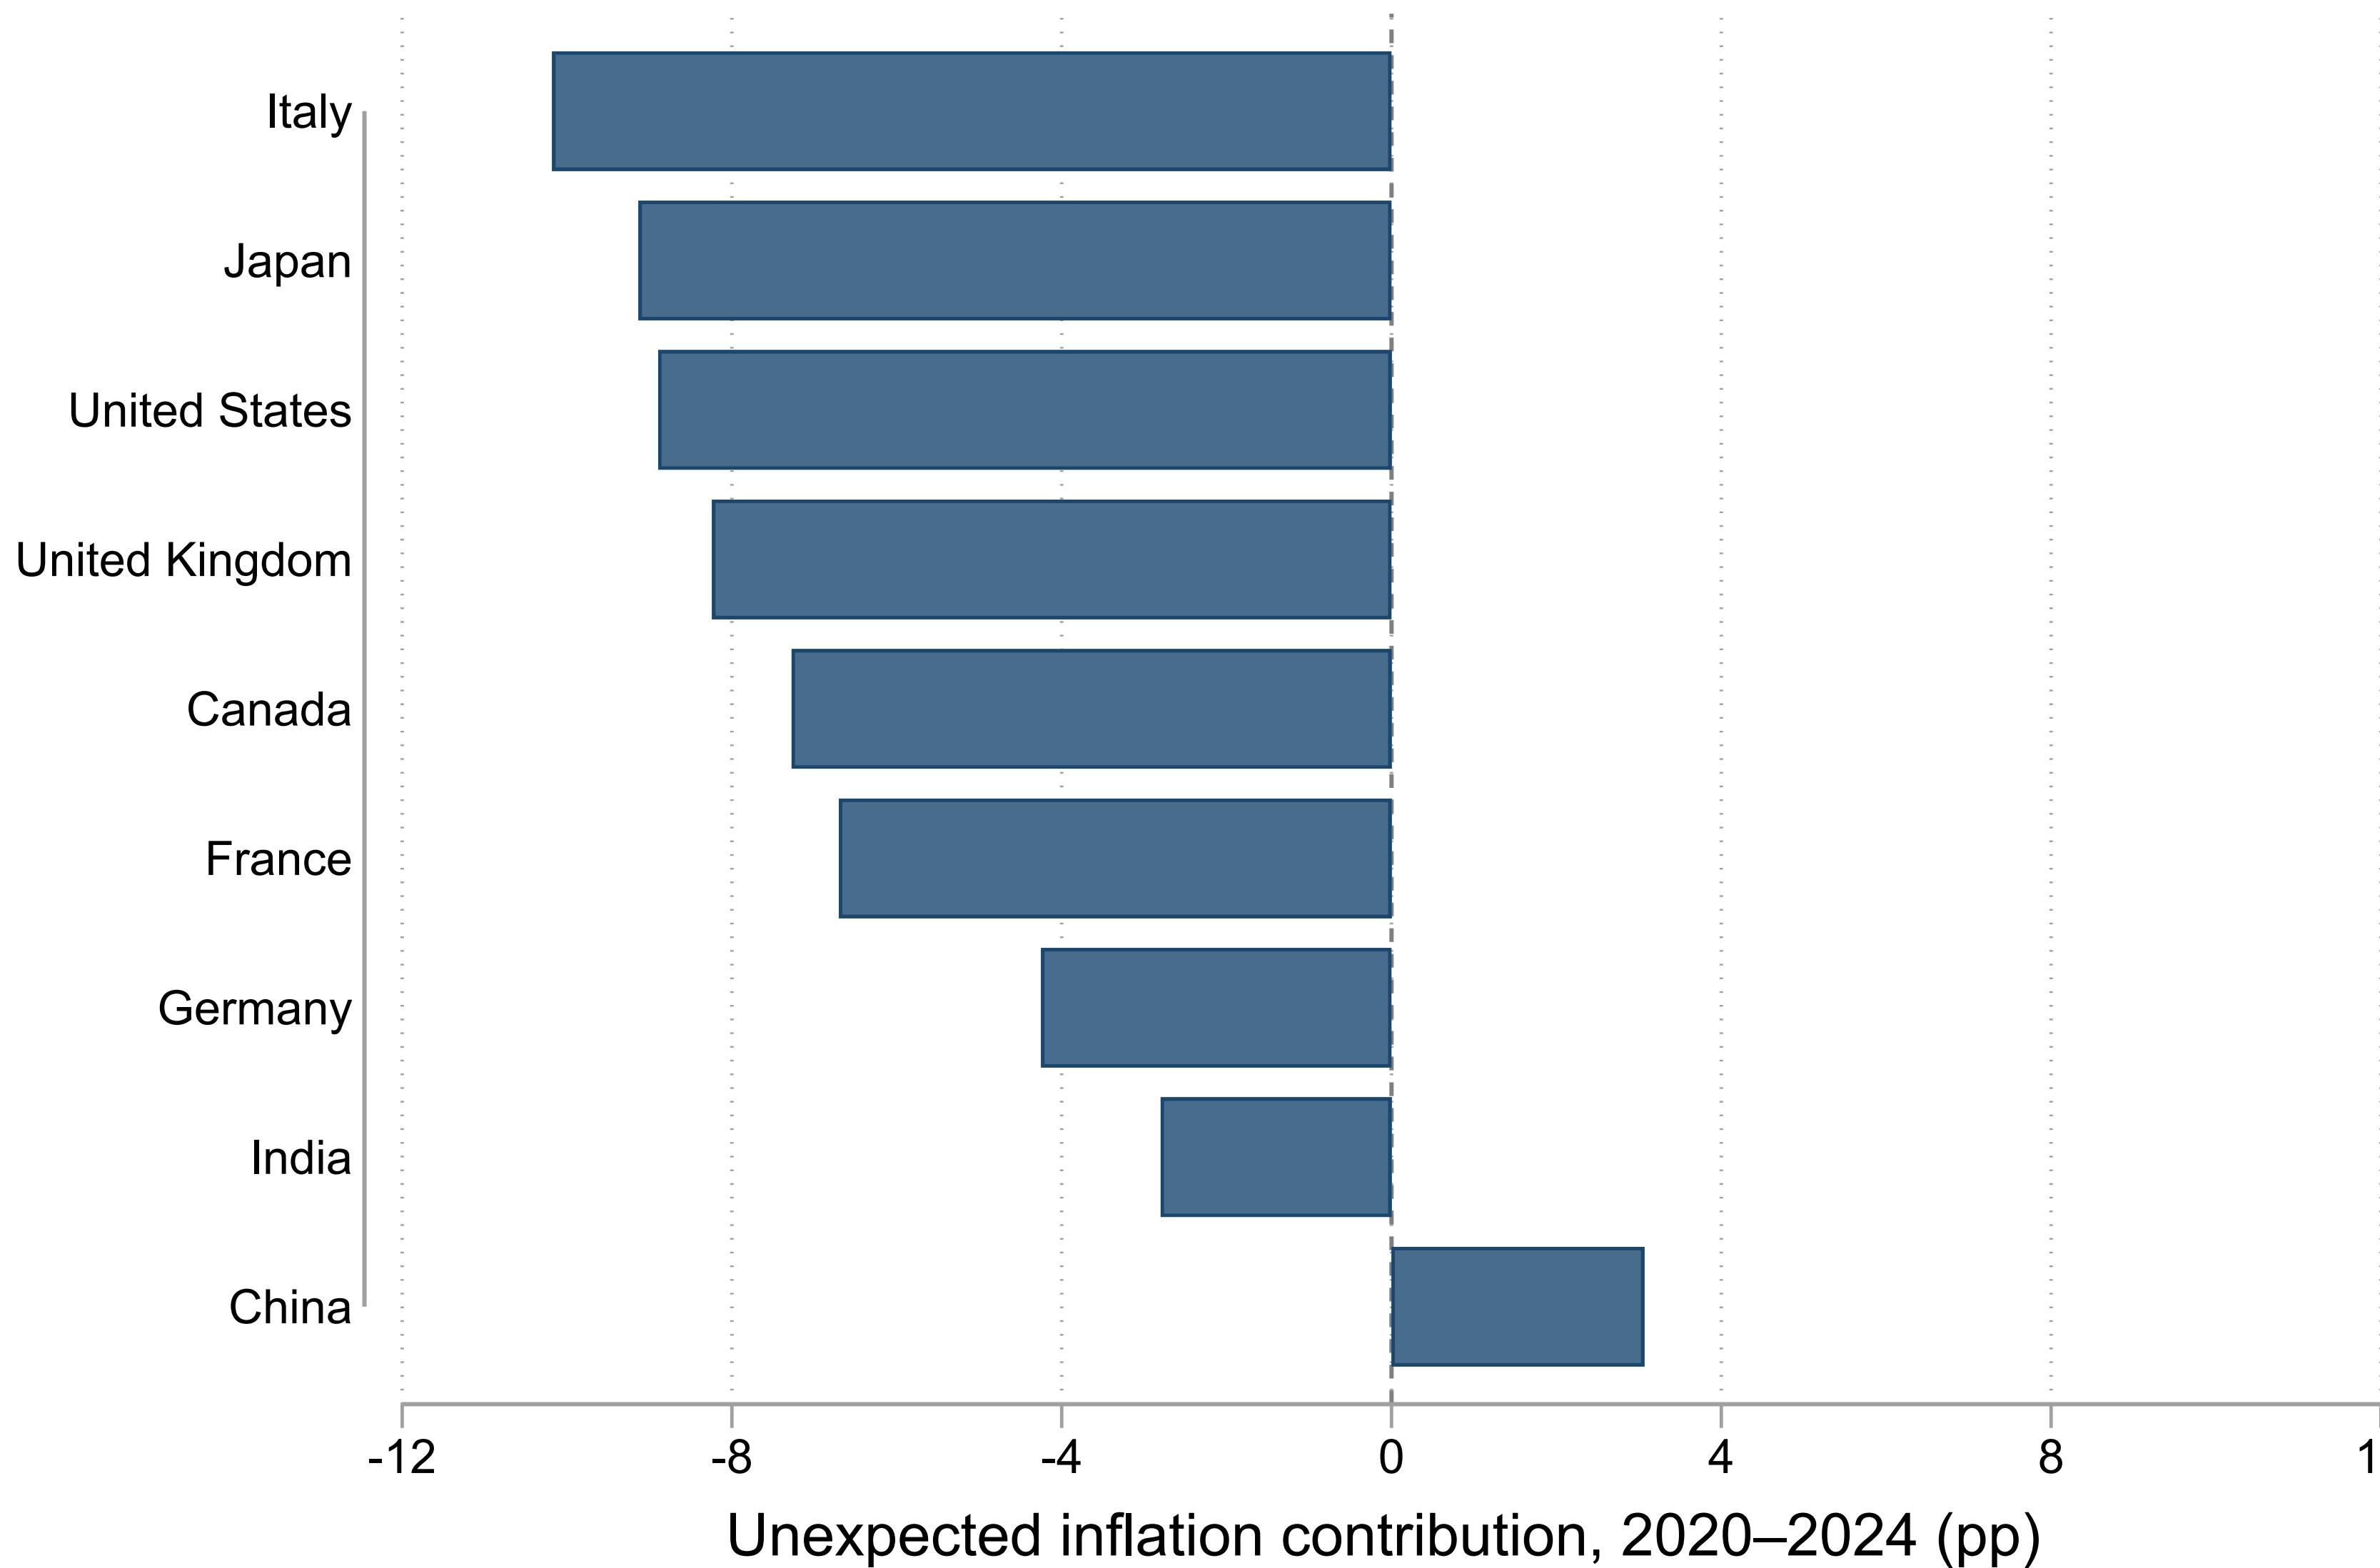

# Surpluses: taxing stocks in the financial sector

*Tax revenue on pension funds / total*

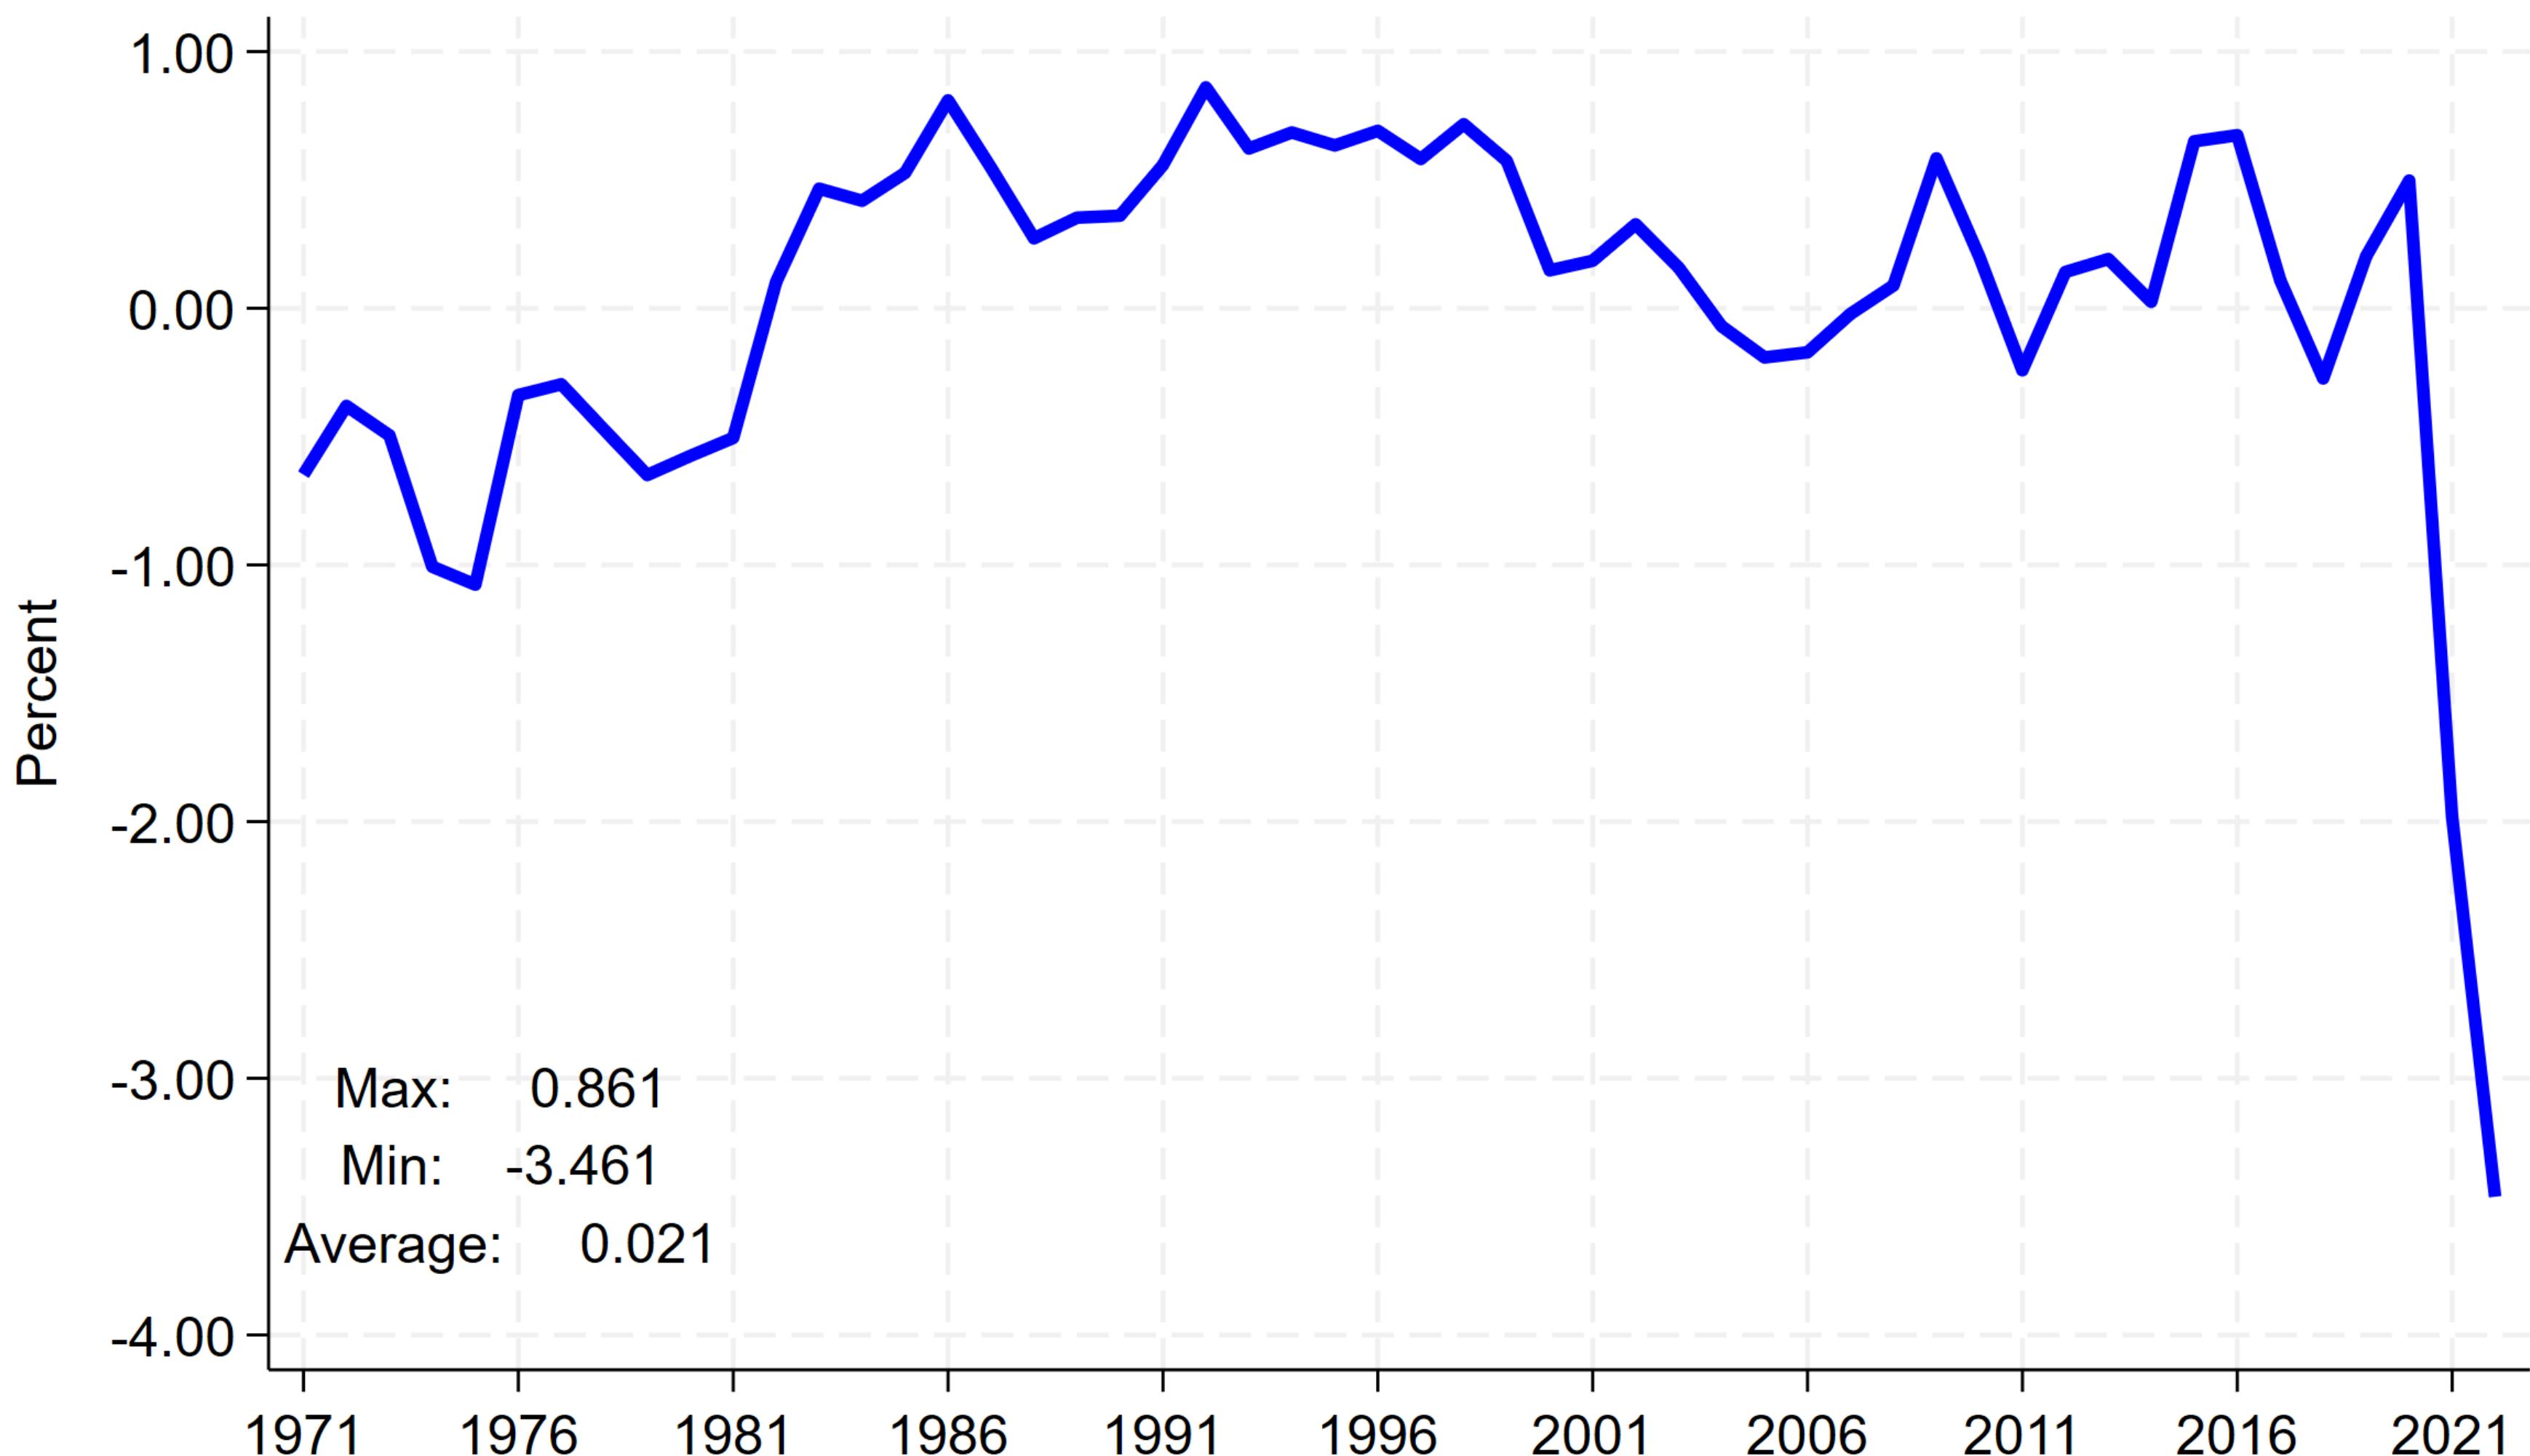

- Ireland, 2011
- 0.6% levy on pension funds' assets for the next three years, rising to 0.75% in 2014 and 0.15% in 2015.
- Example of one-off-tax on holders of assets

# Unexpected inflation: post-pandemic

- Inflation surge across the advanced economies from 2021 onwards
- Exercise: calculate the change in debt due to unexpected inflation, using WEO data on expectations in 2019 and on actual values in 2024
- Significant numbers

# Unexpected inflation: post Bretton Woods

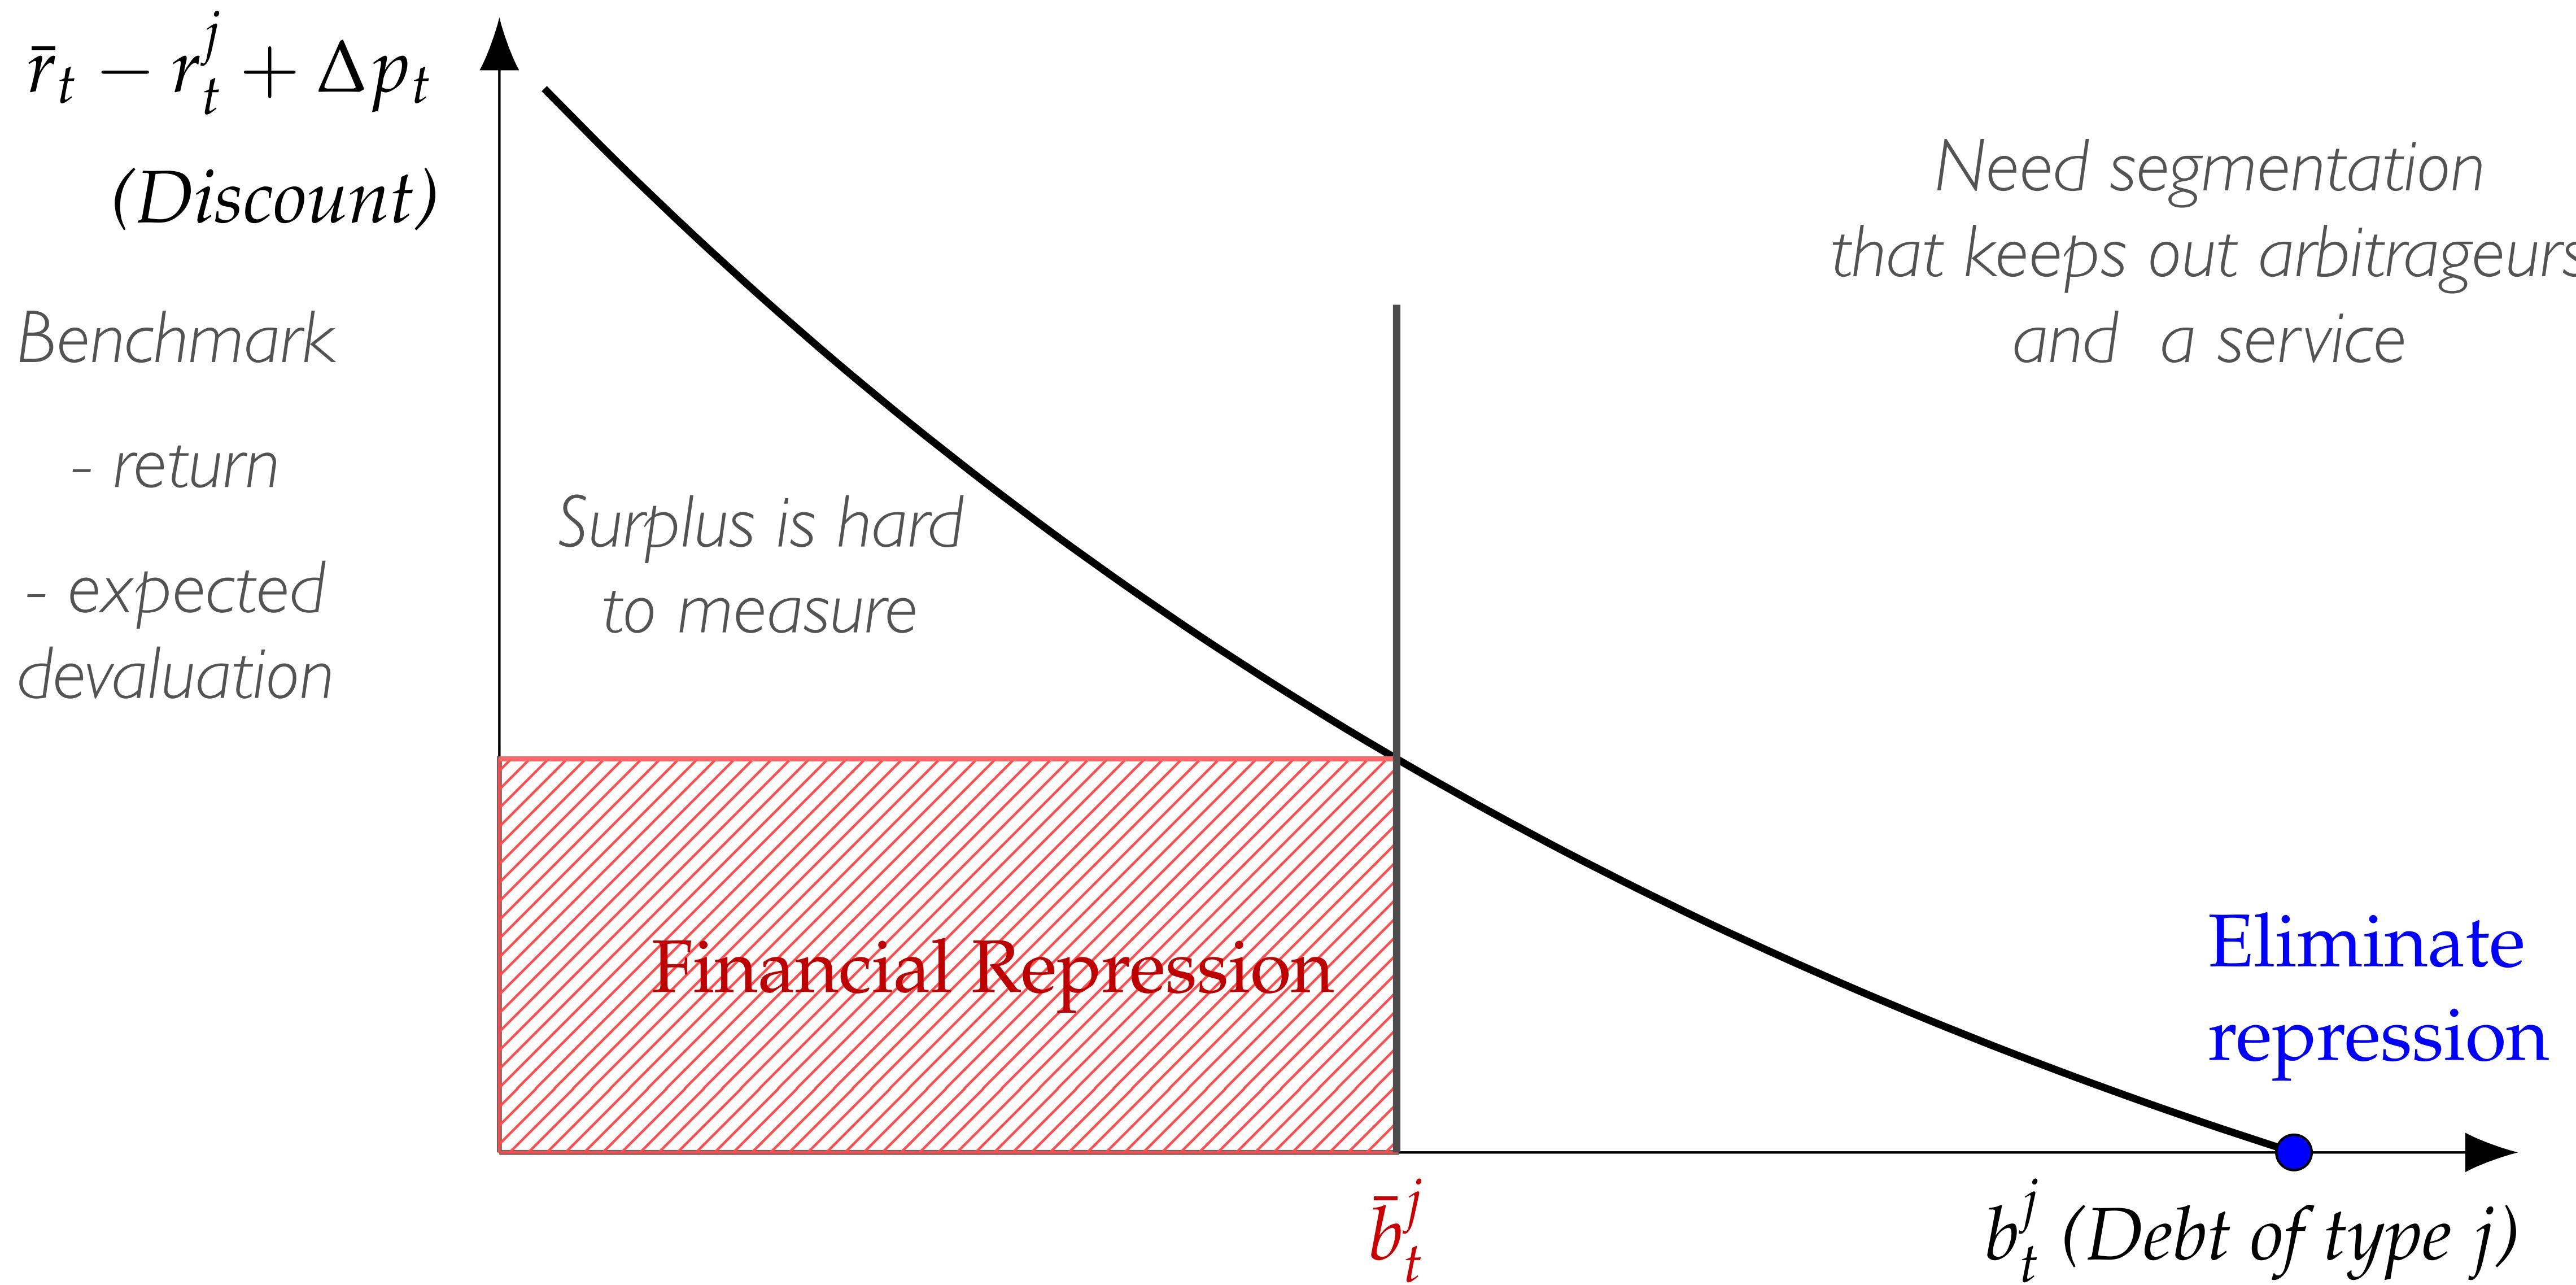

- Using professionals' expectations, same exercise for the US since 1971
- Average is quite close to 0 over 50 years
- But large revenue in 1970s, drag in 1982 - 2003, very large in 2021-22

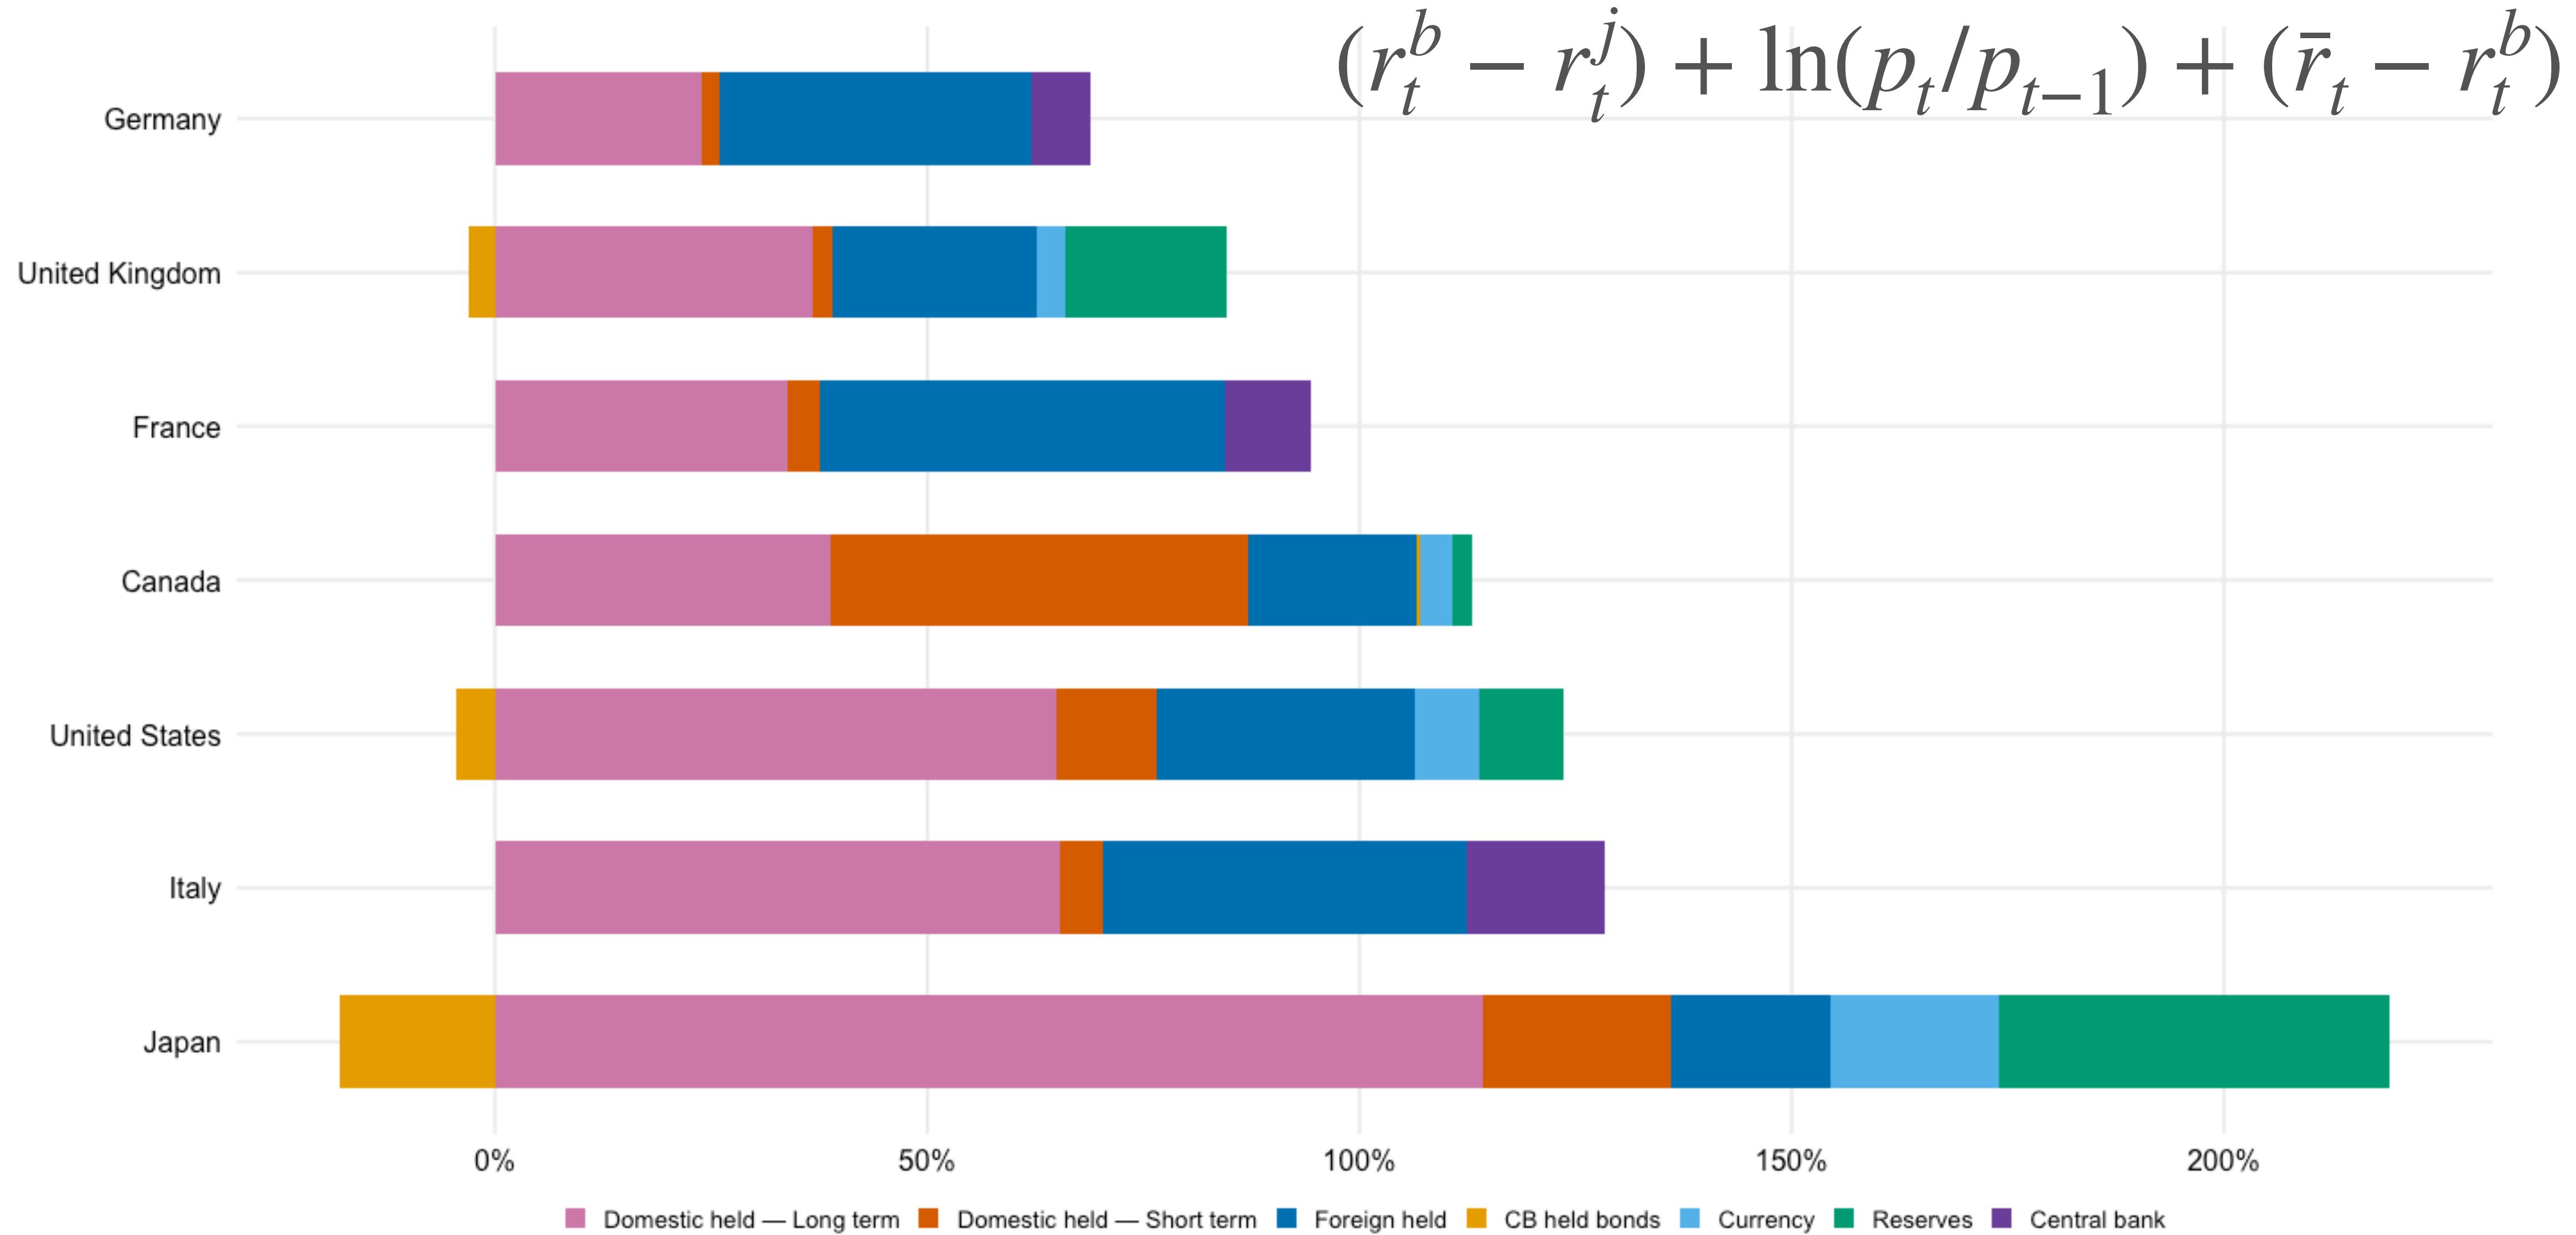

# Unexpected inflation: determinants and future

- **Size of the effect depends on**
  - composition of the debt: indexed to inflation, duration of the portfolio
  - inflation dynamics: delay after loose policy, and persistence afterwards
  - extent of the surprise: subdued and slow-to-move expectations
- **Data on expectations right now shows:**
  - In UK data, long-horizon swap prices overreact when the traders' expects inflation rises (Bahaj, Czech, Ding, Reis, 2025)
  - US professionals' survey expectations of US long-run inflation have become more sensitive to short-run inflation shocks (Reis, 2025).
  - Cost of buying insurance against EA inflation tail events at long horizons through swaption contracts has decisively and persistently increased (Hilscher, Raviv, Reis, 2025)

# The service flow and discounts

# Types of government liabilities and sequencing

# Currency

## Service:

Anonymous transactions/store of value

## Discount:

Zero minus interest rate paid for deposit at the central bank

## Optimal:

Friedman rule (but then cannot choose an inflation target)

In principle could be tokenized CBDC

# Digital money

## Service:

Liquidity for banks

## Discount:

Interest on reserves minus interest on overnight government bond (ONRRP)

## Optimal:

Abundant / ample reserve system

(Or lending rate close to deposit rate)

# Long-term bonds

# Currency denomination

## Service:

Safe stream of income for 20-30 years

Duration for pensions and life insurance

## Discount:

30-10yr spread from preferred habitat

## Optimal:

Supply more long-term bonds

## Service:

Match imports with store of value

Insurance, if appreciate in crisis

## Discount:

Cross-currency basis (CIP deviation)

## Optimal:

Domestics have advantage in doing it

# Funding LOLR

## Service:

Emergency lending for both domestics and foreigners

## Discount:

Spread on lending facility (including swap lines)

## Optimal:

Narrow corridor

# Domestic assets

## Capital controls

**Service:** Access to the capital stock

**Discount:** tax, or CNH-CNY spread

## Exchange rate volatility

Mundell's work (Nobel lecture)

**Service:** save on the limited risk-bearing capacity of currency arbitrageurs

**Optimal:** international currency

# Bonds and the convenience yield

$$(r_t^b - r_t^j) + \ln(p_t/p_{t-1}) + (\bar{r}_t - r_t^b)$$

- **Service:** pledgeability
  - From being information-insensitive, deep liquid markets, regulation
  - Regulation too: liquidity ratios, risk-weighted capital requirements, exemption from leverage limits, eligibility rules central bank lending...
- **Three approaches to measuring this pervasive wedge / convenience yield**
  - Narrow to minimize segmentation: supra-nationals or AAA corporate bonds
  - Broad to avoid MM biases: return on capital stock, or bond-stock correlations
  - Model-based to separate out risk: empirical SDFs from asset pricing

# Quantifying US financial repression

**Table 1:** Assessing the size of US financial repression revenues

|  |  | Revenue % GDP                         |                 |
|--|--|---------------------------------------|-----------------|
|  |  | 2015-19                               | 2021-25         |
| <b>Panel I. Direct taxation term</b>             |  |                                       |                 |
| Income taxes collected over the financial sector |  | 0.089                                 |                 |
|  |  |                                       | 0.086           |
| <b>Panel II. Unexpected inflation term</b>       |  |                                       |                 |
| <i>Expected inflation</i>                        | <i>Actual inflation</i>                  | <i>Debt/GDP (%)</i>                   |                 |
| 1.560  | 1.554                                    | 61.9                                  | -0.023          |
| 2.016  | 4.938                                    | 84.1                                  | 1.955           |
| <b>Panel III. Discounts term</b>                 |  |                                       |                 |
| <i>Convenience service</i>                       | <i>Discount spread</i>                   | <i>Relevant liability</i>             |                 |
| Anonymity  | IOR rate<br>minus zero                   | Currency in circulation               | 0.094<br>0.262  |
| Liquidity  | ONRRP rate<br>minus IOR                  | Bank deposits at the Fed              | 0.024<br>0.014  |
| Duration   | 30-10yr spread from preferred habit      | Government bonds maturity $\geq$ 10yr | 0.014<br>0.023  |
| USD denomination                                 | Treasury covered interest parity         | US gross external liabilities         | 0.399<br>-0.062 |
| Pledgeability                                    | 3yr AAA corporate<br>minus treasury rate | Government bonds held by the public   | 0.438<br>0.508  |
|  | Return on capital<br>minus treasury rate | Government bonds held by the public   | 3.914<br>0.260  |

# Quantifying US financial repression

Table 1: Assessing the size of US financial repression revenues

|  |                                       |                                       | Revenue % GDP |         |
|--|---------------------------------------|---------------------------------------|---------------|---------|
|  |                                       |                                       | 2015-19       | 2021-25 |
| <b>Panel I. Direct taxation term</b>             |                                       |                                       |               |         |
| Income taxes collected over the financial sector |                                       |                                       | 0.089         |         |
|  |                                       |                                       |               | 0.086   |
| <b>Panel II. Unexpected inflation term</b>       |                                       |                                       |               |         |
| <i>Expected inflation</i>                        | <i>Actual inflation</i>               | <i>Debt/GDP (%)</i>                   |               |         |
| 1.560  | 1.554                                 | 61.9                                  | -0.023        |         |
| 2.016  | 4.938                                 | 84.1                                  |               | 1.955   |
| <b>Panel III. Discounts term</b>                 |                                       |                                       |               |         |
| <i>Convenience service</i>                       | <i>Discount spread</i>                | <i>Relevant liability</i>             |               |         |
| Anonymity  | IOR rate<br>minus zero                | Currency in circulation               | 0.094         |         |
| Liquidity  | ONRRP rate<br>minus IOR               | Bank deposits at the Fed              | 0.024         | 0.014   |
| Duration   | 30-10yr spread from preferred habit   | Government bonds maturity $\geq$ 10yr | 0.014         | 0.023   |
| USD denomination                                 | Treasury covered interest parity      | US gross external liabilities         | 0.399         |         |
| Pledgeability                                    | 3yr AAA corporate minus treasury rate | Government bonds held by the public   | 0.438         | -0.062  |
|  | Return on capital minus treasury rate | Government bonds held by the public   | 3.914         | 0.508   |
|  |                                       |                                       |               | 0.260   |

- (1) Pledgeability dominates, but may have fallen
- (2) Large fall in revenues from USD dominance
- (3) Old-fashioned repression from currency and unexpected inflation made a big comeback
- (4) Actual sizes may be impossible to pin down because of a missing intercept

# Potential for more revenues?

**Table 2:** The semi-elasticity of the demand curve for different bond-services

| Service          | Semi-Elasticity<br>(per 100bp) | References in the literature   |

- **Financial repression is not in itself bad.** If financial regulation corrects market failures and also brings some revenue on top of it (financial repression) so be it. Like Pigouvian taxes.
- **Famous distortions:** unexpected inflation, reserve requirements, McKinnon (1960), Shaw (1963)
- **Understudied ones:** CIP deviations, regulation.

# Modern cases: Turkey, June 2022

- **Securities Maintenance Practice:** banks must hold long-term government bonds against loans, deposits, FX.
- **This lecture:** measure by supranational spread
- **Further:** interaction between fiscal and macroprudential policies that face fiscal or financial crisis leading to “unpleasant macroprudential arithmetics” (Reis, 2021)

## ECB adjusts remuneration of minimum reserves

---

27 July 2023

- > Minimum reserves to be remunerated at 0%
- > Change preserves the effectiveness and improves the efficiency of monetary policy

The Governing Council of the European Central Bank (ECB) today decided to set the remuneration of minimum reserves at 0%. The change will become effective as of the beginning of the reserve maintenance period starting on 20 September 2023.

Minimum reserves are reserve balances that credit institutions are required to hold with their Eurosystem national central bank on average over a maintenance period. Credit institutions are required to hold a minimum amount equivalent to 1% of specific liabilities, mainly customers' deposits. Minimum reserves are currently remunerated at the ECB's deposit facility rate (DFR).

- **Policy decision:** remuneration of required reserves went from the interest on deposits to zero
- **This lecture:** this is financial repression, brings €6 bn per year
- **Further:** is this desirable, since there is a spread between the deposit rate commercial banks earn at the central bank and the deposit rates they pay their customers? (Reis, 2023, Bahaj, Hosseini, Reis, 2025).

# Modern cases: UK 2024-2025 pension reforms?

Reeves looks to include minimum UK shareholding in Isa overhaul

Evolution of abandoned Conservative 'Brit Isa' plan also includes stamp

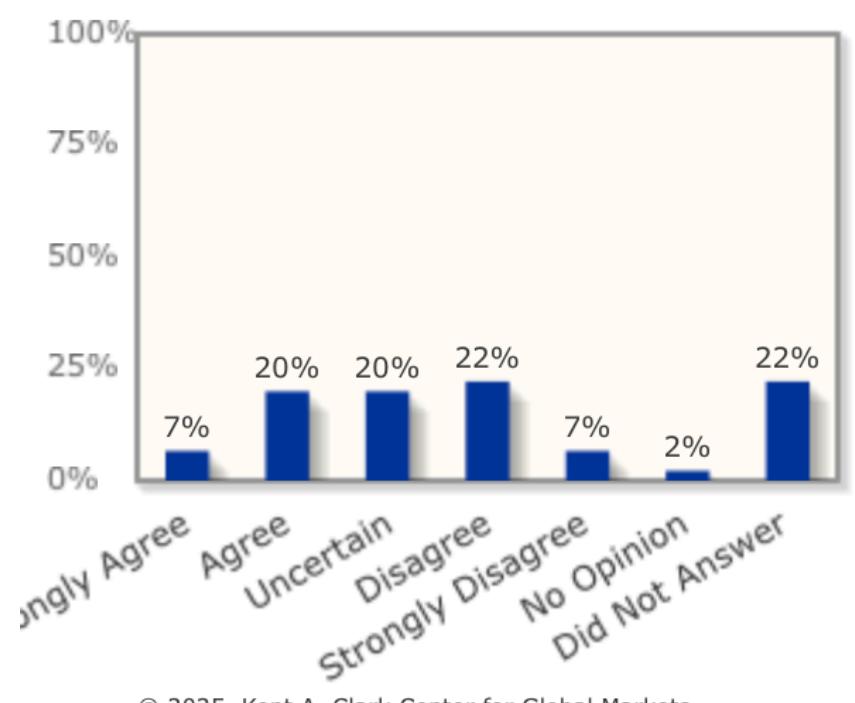

- In UK, 80% of pension funds' assets under management are invested abroad
- Both parties— Hunt in March 2024, Reeves in November 2025?—with proposals to limit tax benefits in ISAs (Roth IRAs) to investments in UK bonds and equity. **Financial repression.**
- **Further:** Draghi report call for domestic capital markets based on pensions funds to invest domestically and recover competitiveness (Reichardt Reis, 2025)

# Modern cases: raising the inflation target

If the European Central Bank changed its inflation target from 2% to 3%, the long-run costs of inflation for households would be essentially unchanged.

Methodology

- By itself, if fully anticipated increase in inflation, then still **financial repression** through zero-interest-paying currency.
- Using the estimates in **this lecture**: extra 1% in the inflation target raises 0.12% of GDP per year in repression.
- **Further**: if ceilings on interest rates of long-term government bonds, or with yield curve control (Japan 2016-24), repression can be large but leads to unanchored inflation (Reis, 2019)

# Modern cases: international provision of USD

- Fed 2010 **swap lines**: lends USD to a foreign central bank, receiving in return as guarantee that central bank's currency as a guarantee, to be returned when the USD are repaid.
- Fed 2020 Foreign and International Monetary Authorities (**FIMA**) **repo** facility: foreign central banks can borrow USD overnight as long as they can offer US treasuries as collateral.
- Move from first to the second is **financial repression** (Bahaj Reis, 2022, Bahaj, Fuchs, Reis, 2024)

# Modern cases: stablecoins and currency

- They **reduce the repression associated with currency**: digital form of payment with some anonymity. And, if deposit at central bank, can pass interest to depositors.
- They **reduce the repression associated with exchange rate volatility**: step towards USD becoming international currency.
- But, if domestic regulations stop them from paying interest, and foreign regulations stop them from being adopted, then **financial repression will continue**.

# Conclusions

- **An economic principle:** the budget constraint of the government and/or nation
- **Applied policy question:** financial repression policies raise revenue through three terms
- **Why come back in XXI<sup>st</sup> century?** Large gross debts, there are regulations with potential in place, it can persistently deviate from zero, it can grow significantly.
- **Should it come back?** Costs and benefits
- If they are actively used, **two open questions**
  - How much will elasticities adjust from short run to long run: **offshore markets**
  - **Role of the IMF**, from 1970-80s liberalization, to capital flow management, to ...
